2.40(b)(2)

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

Four dogs were found to have veterinary care issues that need medical attention. They are as follows:

A female golden retriever (no identification) had discharge coming from both eyes. The eye lids were folded inwards.

A female Chocolate Lab with ten puppies (ID #16) had hair loss on her right rear leg. In addition both eyes appeared crusty.

A female Golden Retriever named Cloudy with three puppies (ID #21) had hair loss on its right rear leg. In addition the left eye appeared to be irritated and discharge was coming from it. The Attending Veterinarian examined the dog years ago and determined the dog had a permanent condition in that eye and no treatment was necessary at the time as it wasn't irritating the dog. However, it appears the dog's condition may have changed since it was last examined.

A female Chocolate Lab (ID #15) had a watery discharge coming from both eyes.

Eye problems can be painful and possibly contagious to other dogs. Hair loss can be caused from a variety of issues, some of which may be contagious and/or irritating to the dog. The licensee must follow up with the Attending Veterinarian to ensure all four dogs receive the appropriate treatments for their conditions. Correct by 4/15/17.

Multiple medications were found to have expired. Oxytocin expired September 2015, Noromectin expired 07/2011, and Triple Antibiotic Ointment expired 04/2013. Expired medications doesn't ensure that the products are safe to use. All expired products must be discarded. Correct by end of business today.

3.11(b)(2)

CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

Inspection Report

Feeders throughout the kennel were grimy. When asked, the licensee informed me that they were last disinfected about a month ago. Multiple cages had dust webs on the fencing parts of the enclosures. Some of the whelping pens started to have grime building up on the back walls of the enclosures. When asked, the licensee informed me that whelping pens get disinfected in between litters. Dust webs on the fencing of the enclosures, grime building up on the feeders, and grime building up on the back walls of some of the whelping pens can contribute to the spread of disease within the kennels. All enclosures and feeders must be sanitized once every two weeks or more often as necessary. Correct by 4/26/17.

This inspection and exit interview were conducted with the licensee.

End of report.
