Type: ROUTINE INSPECTION
Date: 22-SEP-2016

2.40(b)(2)

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

Several llamas, goats and rabbits were observed to have excessively long hooves or nails. Specifically, approximately twenty rabbits in Barn 1 were observed with long toenails. One goat in the Quarantine pen had front hooves with splits and cracks, while the back hooves were overgrown, and several other goats had overgrown hooves. Several llamas, especially the one adjacent to the cow enclosure had overgrown feet that needed trimming. Overgrown nails and hooves can result in injury, discomfort, and/or lameness.

Appropriate methods and services should be employed in order to provide necessary maintenance of nails and hooves for all the animals.

Correction date 11 October, 2016

2.131(b)(1)

HANDLING OF ANIMALS.

Two llamas were wearing halters with lead ropes attached that dragged on the ground and could wrap around their feet. The llama adjacent to the cow pen and the llama mixed with the large herd of sheep wore long lead lines. The llama in the smaller corral with several goats had a slightly shorter lead line, but there was a lasso underfoot and tangling with the llama's feet.

Long lead lines dragging on the ground while animals are loose in their enclosures has the potential to cause trauma, physical harm or unnecessary discomfort if the lead line is caught underfoot or on something in the enclosure. Animals shall be handled in a careful manner that does not cause trauma or physical harm.

Inspection Report

a large pipe underground and into an uncovered animal waste pile containing manure from farm animal species as well. The channel is not adequately flushed and fecal material is built up in the area where the channel transitions from open channel to underground pipe. The open channel with fecal material built up and sprawling waste pile potentially attract vermin and can result in disease hazards.

Animal waste can contribute to unsanitary conditions, vermin infestation, odors, and disease hazards. The facility must ensure that animal waste is removed often enough to minimize any potential contamination, odors or disease hazards.

Correction date 25 October, 2016

3.125(d)

FACILITIES, GENERAL.

The new sheep quarantine/project pen was directly adjacent to the large and uncovered animal waste disposal area. The animal waste disposal area included the runoff from the rabbit breeding barn, as well as the collected waste from the cows, llamas, sheep and goats on the property. This material can attract a variety of pests and could impact the health and well-being of the animals in the enclosure.

A system should be in place to ensure the removal and disposal of animal wastes on a regular schedule so as to minimize vermin infestation, odors, and disease hazards. The disposal facilities shall comply with applicable laws and regulations relating to pollution or the protection of the environment.

Correction date 25 October 2016

3.127(b)

FACILITIES, OUTDOOR.

In the new quarantine/project pen for ten sheep, the only shelter provided is shade cloth stretched over one side of the enclosure and a small cover directly over the food trough. In the larger sheep pen with approximately forty animals, the shelter covered the food trough, but all the sheep could not all comfortably fit under the shelter, and the bedding under the shelter was damp. In the rainstorm earlier this week, the sheep in the quarantine pen had no shelter provided to afford protection and prevent discomfort, and shelter in the larger pen was not sufficient for all the animals, and the uncovered portion of the ground in the enclosure was muddy.

The inability to shelter from seasonal winter rains could cause discomfort to the animals and adversely impact their health. The facility should ensure that all animals housed at the facility have access to natural or artificial shelter to adequately protect all animals from inclement weather and prevent discomfort.

Inspection Report

Correction date 25 October, 2016

3.129(b)

FEEDING.

In the llama and goat enclosure, there was a large raised feed bin. The feed bin contained both food and feces and was tall enough that the young goats in the pen would have difficulty accessing the food.

In the cow enclosure, the hay was on the ground and intermingled with fecal matter.

Any food receptacle, hay manger, or platform used is to be sanitizable (the ground is not considered sanitizable). This feeding situation can negatively impact the health and wellbeing of the animals.

Food and food receptacles shall be kept clean and sanitary at all times and shall be placed so as to minimize contamination and accessible to all animals in the enclosure.

Correct by 25 October 2016

This inspection and exit interview were conducted with facility representatives.
