Type: ROUTINE INSPECTION
Date: 02-DEC-2020

2.75(a)(1)

Records: Dealers and exhibitors.

Records including the acquisition and disposition of animals were not available for review. The licensee stated that they were in Terre Haute, Indiana and were being uploaded into a computer system.

Records must be available for inspection for the inspector to track individual animals such as for monitoring the well-being of animals. For example, they indicate if an animal dies such that the inspector may determine if such deaths resulted from natural events or other issues such as handling. Further, as a Class B licensee, they are vital records in tracing animals such as related to disease outbreaks.

3.78(e)

Outdoor housing facilities.

The primary enclosures of the white-headed lemurs and the snow monkey (Japanese macaque) did not have a barrier between the primary enclosure and the public access areas

Inspection Report

Such barriers are necessary in order to restrict physical contact between the public and the nonhuman primates. Without such barriers, nonhuman primates may injure members of the public by scratching or grabbing the people or their clothing. Additionally, the animals may be injured by actions of the public.

Barriers surrounding primary enclosures for nonhuman primates must be placed in order to restrict physical contact between the public and the nonhuman primates.

Correct by: 01 April 2021

3.81

Environment enhancement to promote psychological well-being.

While there appears to be measures such as environmental enrichment including food enrichment and social interaction with staff members, the facility has no documented plan for the environmental enhancement adequate to promote the psychological well-being of nonhuman primates. Notably absent from the undocumented plan are the social grouping provisions for a common marmoset and a squirrel monkey, both of which are nonhuman primate species known to exist in social groups in nature. Both of these two animals were singly-housed without social interaction of conspecifics or provision of auditory, visual, olfactory or other stimuli from other nonhuman primates.

Adherence to a documented plan that provides for the environmental enhancement needs of nonhuman primates is critical for the health and well-being of these animals. If such enhancement is not provided, ill effects on the health of these animals due to factors such as stress, self-injurious behavior, or stereotypies may develop.

A plan as directed by the attending veterinarian that addresses all sections of this regulation must be developed, documented and followed.

3.127(d)

Repeat

Facilities, outdoor.

While construction of a perimeter fence with a height of at least 8 feet is continuing to be constructed around the primary enclosures of the tigers, there is no such fence surrounding these enclosures. Additionally, one wall of the primary enclosure is made of combinations concrete, wood, and metal fencing, or glass, and are high enough and constructed in a manner that restricts entry by animals and unauthorized persons, but written approval the Administrator has not been given.

There is no perimeter fence of at least 6 feet that completely surrounds the primary enclosures of other animals, such as the badgers, bobcat, lynx and coatis. The licensee stated that a perimeter fence currently surrounds approximately 60% of the facility.

A perimeter fence around the primary enclosures is necessary to aid in the prevention of animal escape, and to keep other animals and unauthorized persons out of the primary enclosures. Without a perimeter fence that contains the animals, they may be injured or killed.

This inspection and exit interview were conducted with the Licensee.
