Type: ROUTINE INSPECTION
Date: 13-JAN-2015

2.40(b)(2)

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

These animals are in need of veterinary care:

**** A six year old male Yorkshire Terrier (chip# 0A10635067) located in the Hog House building had an accumulation of yellowish-grey material covering the entire surface of the few teeth that he had left. The shape of the teeth were no longer visible. This heavy coating of yellowish-grey matter was on the cheek teeth on both sides of his mouth extending up into the gum line. The abnormal buildup of material on teeth can cause damage to the gum tissue and tooth structures, be painful, impact the ability of the dog to eat normally, and harm the health of the animal.

**** An adult female Maltese (chip# 0A106E155B) located in the Hog House building had a heavy coating of brown material on the both sides of the cheek teeth, canine teeth, and incisors extending up into the gum line. The gums have receded up and away from the teeth. These signs are consistent with the presence of dental disease, can be painful, lead to the development of other health problems, and can inhibit the ability of the animal to eat normally.

**** An adult, red female Pomeranian with no official identification located in the Hog House building had a heavy coating of brownish-grey material on the both sides of the cheek teeth, canine teeth, and incisor teeth extending up into the gum line. The material completely covers the upper cheek teeth. The gums are inflamed and there is a white colored discharge at the gum line of the canine and cheek teeth. The gums have receded at the incisors and cheek teeth as well. The abnormal buildup of material on teeth can cause damage to the gum tissue and tooth structures, be painful, impact the ability of the dog to eat normally, and harm the health of the animal.

**These dogs all have symptoms that can be caused by dental problems. Dental disease can be painful and eventually lead to a decrease in appetite. It can also lead to infection in the mouth as well as potential spread of infection to other organs in the body. The licensee must have these dogs evaluated by a veterinarian to obtain an accurate diagnosis and appropriate treatment plan. The licensee must document the follow up care as directed by the attending veterinarian and ensure that all animals receive adequate veterinary care at all times.

Inspection Report

**** An adult, female black and white Shih Tzu (chip# 0A106E1B3C) located in the Hog House building had a red, blood-like liquid covering the entire sclera/white area of her left eye. This could be caused by infection, allergies, injury, irritation or other medical conditions that could be painful. The attending veterinarian had not been consulted nor had any treatment been provided at the time of inspection. The licensee stated that this was the first time the eye had been noticed. Eye problems can be painful causing discomfort which affects the health and well-being of the dog. The licensee must have this animal examined by a veterinarian to obtain an accurate diagnosis and appropriate treatment plan. The outcome of this consultation must be documented and provided to the inspector upon request. The licensee must ensure all animals receive adequate veterinary care at all times.

To be corrected by: 1-19-2015.

3.1(e)

HOUSING FACILITIES, GENERAL.

**** In the Hog Barn building in the food storage area there was an open sack of dog food located on a pallet on the ground and an open plastic bucket full of dog food without a lid. The feed is being fed to over one hundred dogs. All open feed supplies must be stored in a manner that protects it from spoilage, contamination, or vermin infestation. The nutritive value of the feed could be affected if it becomes spoiled or contaminated. Spoiled or contaminated feed is not healthy for the dogs to consume and could lead to health issues. The licensee must keep all open feed supplies in leak proof containers with tightly fitting lids at all times.

To be corrected by: 1-14-2015.

3.11(d)

CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

**** In the food storage area of the Hog Barn building there was a large amount of rodent feces on the floor and on other surfaces inside the building and around the sacks of dog food. This indicates a living area exists for rodents, pests and other vermin. Live traps and baits were being utilized by the licensee and were observed during the inspection, but weren't as effective as they should be. Lack of an effective program that controls rodents can create unsanitary conditions and lead to potential spread of disease from rodents to dogs. The licensee must ensure all areas of the facility are kept clean to promote the health and well-being of the dogs and reduce contamination by pests in animal areas. The licensee must establish a much more effective pest/rodent control program.
