Type: ROUTINE INSPECTION
Date: 12-DEC-2022

3.31(a)(1) Critical

Sanitation.

At the time of inspection, there is an empty enclosure in the tortoise room of the Reptile House which recently housed three adult guinea pigs. The floor of the enclosure is uniformly covered in 1-2 inches of feces, food debris and moist, soiled straw bedding, and there is a strong ammonia smell present. When the inspector inquired as to the location of the guinea pigs, the facility representative called zoo staff and was told that the animals were found deceased, one on 12/7/22 and the other two on 12/11/22. The caretaker observation log for those days does not indicate any abnormal findings, including the finding of the deceased animals, and the facility representative did not know when the guinea pig enclosure was last cleaned. The facility representative stated that all three of the guinea pig carcasses are frozen, awaiting necropsy from the veterinarian. Failure to adequately sanitize primary enclosures as frequently as needed can result in noxious fumes as well as accumulation of feces and other debris that can foster microbial growth, attract pests and vermin, and cause discomfort, distress, illness and death. The licensee must ensure that primary enclosures are cleaned and sanitized often enough to prevent an accumulation of excreta or debris, and not less than once every two weeks in the manner provided in Section 3.31(a)(4) of the Animal Welfare Act and Animal Welfare Regulations.

Inspection Report

Housing facilities, general.

There are two containers of cleaning chemicals stored on the shelf above bags of primate diet inside the commissary. A facility representative removed the chemicals to a separate storage area at the time of inspection. Storing chemicals near food can allow the food to become contaminated, leading to animal illness or death. Supplies of food and bedding must be stored in a manner that protects them from spoilage, contamination and vermin infestation. Substances that are toxic to nonhuman primates but that are required for normal husbandry practices must not be stored in food storage and preparation areas, but may be stored in cabinets in the animal areas.

CORRECTED AT THE TIME OF INSPECTION

3.125(a)

Facilities, general.

In the indoor portion of the enclosure housing two adult genets, there is an electrical outlet with a heating appliance plugged into it. There is plastic conduit covering most parts of the electrical cord, but only old, soiled tape covering some of the outlet, electrical plug and wire. There are no solid barriers to prevent the animals from potentially having direct contact with some parts of the outlet box, plug and electrical wire. Animal access to these items poses a risk for injury or death due to electric shock or other injury. The licensee must ensure that facilities are constructed of such material and of such strength as appropriate for the animals involved, and housing facilities shall be structurally sound and maintained in good repair to protect the animals from injury.

3.131(d)

Repeat

Sanitation.

Inside the haybarn, peacocks and other birds roost above and nest on the straw bedding and hay used for feeding. Feces have fallen inside the haybarn on and around the hay and bedding. There are no effective methods in place to prevent the entry of birds or other vermin. The presence of pests and vermin encourages contamination of food and
