

Inspection Report

City Of Clovis
500 Sycamore Street
Clovis, NM 88101

Customer ID: **3489**
Certificate: **85-C-0006**
Site: 001
CITY OF CLOVIS

Type: ROUTINE INSPECTION
Date: 06-APR-2023

3.125(a)

Repeat

Facilities, general.

****The primary enclosure housing one, adult male spotted hyena is in disrepair:**

There is a section of partially buried chain link material in the dirt outside of the shelter entrance. The exposed chain link has sharp points protruding upward where the animal could easily come into contact with it, as well as a gap between the chain link and the ground through which feet and legs could pass. The metal panels on the side of the primary enclosure fence closest to the zoo entrance are held together by sheet metal screws with sharp points that protrude inward where animal contact is possible. The metal paneling on the side of the primary enclosure fence farthest from the zoo entrance, as well as in one spot above the entrance to the shelter, has holes where the metal is torn; there are sharp edges with which the animal could easily come into contact.

****The pen housing five, adult bison has a metal gate which has a 14" gap between its bottom edge and the ground, along the entire length of the gate. The gate is also located near a section of the perimeter fence that has holes large enough for a small- or medium-sized animal to enter.**

Sharp points and gaps pose risks for animals due to cuts and entrapment. Primary enclosures with large gaps can provide an entrance for other animals to enter or be a source for entrapment.

The licensee must ensure that primary enclosures are constructed of such material and of such strength as appropriate

for the animals involved, and that they are maintained in good repair to protect the animals from injury and to contain the animals.

3.127(d)

Repeat

Facilities, outdoor.

The perimeter fence is in disrepair:

**The section bordering the ballpark has two sites where the chain link is torn and/or bent away from the bottom edge, creating holes ~7" wide by ~10" tall.

**The section nearest the marmoset enclosure is detached from the post, causing the fence to sag inward and rendering it unstable.

Perimeter fences that are in poor repair or which are unstable, cannot serve as effective secondary containment for the animals at the zoo and can be an entry point for unauthorized persons or predators that could cause harm to the animals.

The licensee must ensure that all perimeter fences at the facility are of adequate height and in good repair to maintain their strength and integrity. The perimeter fence must be a minimum of three feet away from any primary enclosures and constructed so that it protects the animals by restricting entry of outside animals and preventing unauthorized persons from going through it, or under it, or having contact with the animals in the facility.

3.131(c)

Sanitation.

In the barn containing the primary enclosure for two, adult Southern tamandua, there is a collection of rubble and stored items which is covered in dust and located near the sides of the wire-paneled, primary enclosure. The front, interior wall of the barn is damaged, with holes that communicate to the outside; the baseboards along one wall are pulled away, creating unsealed gaps.

Accumulations of debris or rubble, and cracks in walls and baseboards can harbor pests or vermin which can cause injury

or illness to animals. The facility must ensure that premises (buildings and grounds) are kept clean and in good repair in order to protect the animals from injury and to facilitate husbandry practices; accumulations of trash shall be placed in designated areas and cleared as necessary to protect the health of the animals.

TO BE CORRECTED BY 04/21/2023

This inspection and exit interview were conducted with the zoo director.
