Type: ROUTINE INSPECTION
Date: 17-SEP-2018

2.40(b)(3)

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

Male Poodle with chip number 033 288 599 ("Ode" DOB 12/2008) is squinting his left eye. There is clear drainage collecting around the left eye and eyelids. The "white of the eye" is more red on the left side when compared to the right. There is a white color visible within the left eyeball. The licensee had not identified this problem before the inspection and had not communicated the problem to the attending veterinarian. The program of veterinary care does not instruct the licensee on how to address this problem. Eye problems can be caused by infection, trauma, eyelid conformation, and other medical problems. The squinting suggests that this eye is painful.

Female Pomeranian with chip number 017 582 367 ("Princess" DOB 4/2012) has a heavy buildup of dental calculus on all of the visible molar and premolar teeth ("cheek teeth"). On the left side there is one loose lower premolar and one loose upper premolar. Both teeth are easily moved. The licensee had not identified this problem before the inspection and had not communicated the problem to the attending veterinarian. The program of veterinary care does not instruct the licensee on how to address this problem. The loose teeth indicate that there is dental disease present in this dog. Dental disease can be painful as it can cause damage to the gum tissue, teeth, and the bone of the jaw supporting the teeth. Dental disease can also impact the ability of the dog to eat normally and affect the overall health of the animal.

The conditions of these two dogs are clearly seen and should have been observed by the licensee. The conditions also appear to have started to be a problem well before the last daily observation. The licensee must observe all animals at least daily to assess their health. There must also be a mechanism of direct communication that is frequent enough so that timely and accurate information on problems of animal health are conveyed to the attending veterinarian. To be corrected by 19 Sept 2018.

2.50(a)(1)

TIME AND METHOD OF IDENTIFICATION.

Of the 31 adult dogs at the facility, 14 do not have identification. Proper identification is essential for tracking the movement of animals and to facilitate the inspection process. The licensee uses microchips in the rest of the dogs that are identified. This is one of the appropriate means of identification. The licensee must ensure that all live dogs
