Type: ROUTINE INSPECTION  
Date: 02-AUG-2016

### 2.40(b)(2) REPEAT

#### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

One female camel which was recently acquired by the licensee continually holds her head upwards (star-gazing) and puffs out her cheeks in a nonstop, repetitive manner. This animal must be evaluated by the attending veterinarian to assure that there is no physical injury or disease process which is causing this behavior. The attending veterinarian must be consulted to determine if any medical intervention is required to treat this condition. To be corrected by: August 10, 2016.

A female coati mundi born on 4-25-16 has been declawed and the canine teeth have been removed. Declawing can cause pain, discomfort, or other pathological conditions. Declawing of an animal is not appropriate veterinary care, unless prescribed for the treatment of an individual medical problem of the foot. These declaws were not done for this purpose. Likewise, the removal of the canine teeth in this animal is not appropriate veterinary care, unless prescribed for the treatment of an individual dental problem. The removal of the canine teeth was not done for this purpose. Individual animals must not be declawed or defanged in the future.

### 3.75(a)

#### HOUSING FACILITIES, GENERAL.

Two lemurs are housed in an expanded metal cage which is extremely rusted along the bottom and in the area where the feed bowls are placed in the cage. The rust has compromised the structural integrity of the cage to the point that the two nonhuman primates could injure themselves on the sharp rusty metal edges. This cage must be repaired or replaced to protect the two animals housed in it. To be corrected by: October 28, 2016.

Prepared By: JEANNE KJOS, D V M USDA, APHIS, Animal Care

Date:

## Inspection Report

---

### 3.75(c)(3)

#### HOUSING FACILITIES, GENERAL.

In two cages housing a total of four marmosets, there was approximately 25% of the surface of the cage floor covered by old food debris. All hard surfaces which nonhuman primates come in contact must be spot-cleaned daily

and sanitized to prevent accumulation of disease hazards. Food waste must be removed to eliminate odors, diseases, and pest infestation. These cages must be cleaned and food waste removed daily to prevent disease and pest problems. To be corrected by: August 5, 2016.

Multiple cages in the ringtail lemur building had excessive food debris on the cage flooring. All cages must be spot-cleaned daily to prevent accumulation of food waste and to prevent pest control issues such as flies and roaches. All cages in this building must be cleaned and food waste removed daily to prevent pest control problems and potential disease transmission. To be corrected by: August 5, 2016.

### 3.83

#### WATERING.

At the time of this inspection, there was no drinking water available to any of the four gibbons housed in two outdoor enclosures. Potable water must be offered to non-human primates as often as necessary to ensure their health and well-being, but no less than twice daily for at least 1 hour each time. During the high summer temperatures, water receptacles must be checked multiple times each day to assure animals have access to drinking water.

To be corrected by: August 2, 2016.

### 3.85

#### EMPLOYEES.

At the time of this inspection, it appeared that facility personnel were not checking on the gibbons drinking water or spot-cleaning the marmosets and lemurs on a daily basis. Every facility with non-human primates must have enough

employees to carry out an appropriate level of animal care and husbandry. The employees must be trained and supervised by an individual with the proper knowledge, background, and experience in the care of non-human primates. The employer must be certain that the employees can perform to these standards.

To be corrected by: August 3, 2016.

### 3.125(a) REPEAT

#### FACILITIES, GENERAL.

In the front zebra outdoor enclosure, there were several layers of fencing along the bottom of the chain link fence.

## Inspection Report

---

There are pieces of wire protruding inward along the bottom of the fence which could injure the animals. Several of the metal cross bars supporting this section of fence are extremely rusted. These areas of rusted and broken fencing

must be repaired or replaced to protect the animals from injury.

To be corrected by: October 28, 2016.

The red deer gate has a piece of expanded metal along the bottom of the chain link. There are also gaps in the gate

fencing where the animals could injure a leg. This gate must be repaired or replaced in order to protect the animals from injury. To be corrected by: October 28, 2016.

In the Ibex outdoor enclosure, there is a wooden shelter with a sagging section of roofing material. This sagging piece of plywood appears to be detached from the shelter structure and could possibly fall onto the animals inside the shelter. There are also two pieces of plywood laying on the ground in the vicinity of the shelter which could potentially injure the animals. This shelter must be repaired or replaced in order to protect the animals from injury.

To be corrected by: October 28, 2016.

Facility inspection was conducted by Jeanne Kjos, VMO and Cindy Digesualdo, VMO with facility representatives on August 2, 2016.

Exit briefing was conducted by Jeanne Kjos, VMO and Cindy Digesualdo, VMO with facility representatives on August 3, 2016.

### Additional Inspectors

Digesualdo Cynthia, Veterinary Medical Officer
