Type: ROUTINE INSPECTION
Date: 24-OCT-2017

2.40(a)(1) CRITICAL REPEAT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

According to the licensee the following animal deaths have occurred since the last inspection:

A male kangaroo was found deceased approximately three weeks ago. A four horned sheep was found deceased approximately two months ago. A Bennet Wallaby and a miniature horse were found dead several weeks ago. An Axis and an Aoudad were found deceased this morning.

The attending veterinarian was not notified about any of these animal deaths, nor does the licensee know how the animals died. He did say that many of these animals were found with a fresh wound on their side. Without appropriate methods to diagnose and treat injuries and illness, animal conditions may worsen or in this case, the animals condition may become fatal. Animals must have access to adequate veterinary care as prescribed in the formal arrangements.

2.40(b)(2) DIRECT REPEAT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

A black and white female goat in the petting zoo area continues to have what appeared to be an abnormal growth coming from the rectum area causing swelling, discoloration, and a wet buildup around the rectum. Several goats and two pigs in the petting zoo area had an excessive hoof growth.

A mature aoudad ram continues to be unable to use either front foot/leg in a normal manner when walking and the front hooves appear to be overgrown. The animal was seen ambulating on the knees and when attempting to weight bear on the front feet an obviously abnormal, exaggerated gait and weight shifting was apparent. The attending veterinarian has not reexamined the animal in at least two months. Abnormal postures and gaits can indicate a serious, painful problem with the feet.

2.75(a)(2) REPEAT

RECORDS: DEALERS AND EXHIBITORS.

Prepared By: COX BRENTON, A C I USDA, APHIS, Animal Care

Date:

Inspection Report

Three Llamas were recently given to the licensee. However, no record of acquisition, or any other written documents stating where these animals or any other animal on at the facility came from could be presented to the inspectors.

At least six animals have expired since the last inspection. However, no documentation or dates could be presented.

Records of animals on hand, acquisition, disposition, and transportation of all animals that come go or reside in the facility grounds is essential and necessary in order to properly track the animals whereabouts at any given time. The licensee must develop a record of all mammals exhibited on the facility grounds and ensure that it is kept up to date as needed when animals are born, expire, or are bought, sold or otherwise transferred on or off of the facility grounds.

2.131(d)(2) REPEAT

HANDLING OF ANIMALS.

At least a dozen members of the public were observed feeding and touching a white tailed deer in the sitting area outside of the petting zoo in which there was no identifiable attendant present. No attendants and/or no or inadequate barriers were present in the following areas in which the public could have access to animals: Giraffes, cavies, goats, pigs, sheep. With out an adequate number of employees, there is a significant health and safety risk for both the animals and public. The licensee must ensure that areas with public access be attended by an adequate number of knowledgeable employees or have adequate barriers to ensure that the animals remain secured and unmolested in their enclosures.

3.127(d) REPEAT

FACILITIES, OUTDOOR.

The entire facility ground is surrounded by a perimeter fence. However, a majority of the hoofstock animals have free range access within the complex and are not enclosed in any type of pen causing the complex fence to act as a large single enclosure without any sort of perimeter fence or secondary containment.

The licensee stated that the perimeter fence is approximately 7.5 feet tall. One rhinoceros at the facility requires a perimeter fence at least 8 feet fall.

An appropriate perimeter fence is required to prevent public contact with the animal and to serve as secondary containment. Perimeter fences less than 6 feet high or less than 8 feet high for dangerous animals, such as the rhino, must be approved in writing by the Administrator and the facility would need to send in a variance request for this.

Inspection Report

3.129(b) REPEAT

FEEDING.

The Javalina enclosure contained animal feed and vegetables that appeared to have been dropped onto the ground inside the enclosures instead of being placed into sanitized receptacles. Contamination of food by animal waste, insects or vermin can cause animals who ingest it to become ill. Food must be given to animals in sanitized receptacles.

3.132 REPEAT

EMPLOYEES.

The licensee continues to have the same number of employees as he did at prior inspections. Based on the number of noncompliances, animals observed with health abnormalities, and animal deaths since the prior inspection, the facility does not have an adequate number of trained and knowledgeable employees to conduct adequate husbandry practices. Without an adequate number of employees, the facility can fall into disrepair, animals with health problems may go unnoticed and there is a health and safety risk to the public. The licensee must gain a sufficient number of adequately trained employees, supervised by a person or persons with a background in animal care.

This inspection and exit interview were conducted with ACI Cox and SACS Yager on 10/24/2017.
Exit interview was conducted with ACI Cox on 10/25/2017.
