Date: 22-MAR-2016

### 2.40(a)(1)

#### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

The facility does not have a current written program of veterinary care approved by the current attending veterinarian. The facility has a program of veterinary care signed on 10/9/2014 by the previous attending veterinarian. A written program of veterinary care is necessary to ensure that the facility staff understands the expectations of the attending veterinarian in regards to the care and use of the animals. A program of veterinary care must be written, approved by the current attending veterinarian as part of the formal arrangement between the facility and the attending veterinarian, and the facility must have a copy of the program in order to ensure adherence to the program of veterinary care.

Correct by: April 5, 2016

### 2.40(b)(2) REPEAT

#### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

Ten guinea pigs were found during inspection which had health issues.

Four had eye issues. One black and white juvenile guinea pig's right eye was pasted closed with a greenish discharge. Licensee caught the individual and opened the eye, though it remained squinty.

One adult red and white guinea pig has a squinty left eye which it held persistently only partially open.

A brown and white adult guinea pig has a left eye which only partially opens. The eyelids appear thick and rough looking. Licensee stated the eye has always been that way, but there is no documentation showing that it has been evaluated by a veterinarian for diagnosis or possible treatment.

A black and white adult guinea pig is wet on the right side of its face. The mucoid discharge appears to be coming from the right eye. This guinea pig is also missing hair under the chin. The right side of the neck and face is hairless.

## Inspection Report

---

Another white and brown adult guinea pig is also missing hair on its neck and face.

A black and brown adult guinea pig is missing hair in the middle of its face. The lesion appears to have thickened skin and is scaly.

A grey/brown guinea pig has a firm lump under its chin on the right side of its neck. The lump is smooth, firm and about walnut sized.

A black and white female guinea pig appears thin, dull, and has a sparse haircoat. Licensee stated she had recently given birth. Her right ear is thick and has a raw lesion on it.

A black and white adult guinea pig is reluctant to move and breathing heavy.

A brown and white juvenile guinea pig appears unable to walk in a straight line, unless it is near the wall of the enclosure. This guinea pig persistently circles to the right.

These guinea pigs require veterinary care for their health and well being. Licensee must use appropriate methods to prevent, control, diagnose and treat diseases and injuries. These animals must be examined by a licensed veterinarian for diagnosis and treatment. Documentation of the veterinarian's assessment, treatment, and plan shall be maintained for examination by APHIS officials

Correct by: Remains Uncorrected

### 2.75(b)(1) REPEAT

#### RECORDS: DEALERS AND EXHIBITORS.

The licensee currently only tracks sales by maintaining sales receipts. The licensee was able to give an approximate number of animals on hand, but had no records verifying the inventory. There were also no records of any births and no records of any deaths (either natural or by euthanasia) occurring in the last six months. Accurate records of all acquisitions (including births) and dispositions (including deaths) are necessary to evaluate trends and monitor the health of the colony. Correct by developing and maintaining all required records including all acquisitions and dispositions.

## Inspection Report

---

3.30

### **WATERING.**

The water receptacles are too dirty. Wet bedding and a dark brown substance is adhered to the water receptacles and water lines. The wire mesh of the primary enclosures near the water lines and pipes is encrusted with a dark material. This environment is ideal for bacteria and other health hazards to grow, posing a health risk for the animals. All watering receptacles shall be cleaned and sanitized when dirty.

Correct by: March 29, 2016

Exit interview conducted with Licensee.
