BRIDGES FOR BRAIN INJURY
INC

Type: ROUTINE INSPECTION

Date: 22-FEB-2021

3.75(b)

Housing facilities, general.

*** There are extra crates and husbandry supplies stored behind the lemur enclosure that have collected excess dust and debris. These items should be maintained in a separate area and the area behind the lemur clear of clutter to facilitate cleaning of the area.

Correct by: Feb 28, 2021

3.81(c)(4)

Environment enhancement to promote psychological well-being.

*** The facility's current plan to provide for environmental enhancement was written for the green monkey that is no longer housed at the facility. There is no current plan developed and documented to address the psychological needs of the Ring-tailed lemur at the facility who is single housed without access to any other non-human primate. This is a three-year-old intact male who has started to show increased aggression towards staff when crating for cleaning purposes. Individually housed nonhuman primates that are unable to see and hear non-human primates of their own or compatible species require special attention within this enrichment plan. A plan needs to be developed and in accordance with current professional standards and as directed by the attending veterinarian for this animal's health and psychological wellbeing.

3.125(a)

Facilities, general.

*** There is chicken wire used in the Geoffrey's cat enclosure to cover larger gaps between the door and frame. This wire is thin and at the bottom of the door is bending upwards creating sharp points into the enclosure. This section of wire needs to be maintained in good repair for the safety of the animals.

*** The black rubber tub that is in the Coypu enclosure is in disrepair with holes in the side of the bucket that appear to have been chewed. This bucket should be replaced for the safety of the animal and to keep items inside the enclosure in good repair for the safety of the animal.

Correct by: March 2, 2021

3.128

Space requirements.

*** The facility's single housed Coypu is a semi aquatic subtropical rodent currently housed in an enclosure in the main building that does not provide sufficient space for the animal to engage in species normal postural adjustment and social behavior of burrowing, taking cover, or swimming. The animal is provided with a stainless-steel bowl filled with several inches of water in which it accesses to defecate. The animal care staff has noticed this animal displays an increased amount of pacing since moving it inside and has attributed it to lack of appropriate space. Abnormal behavior patterns such as pacing can be an indicator of stress in an animal that does not have adequate space for normal postural adjustments and social behavior. The licensee must ensure the enclosure space and design meet the social postural
