ZOOWORLD ZOOLOGICAL & BOTANICAL CONSERVATORY

Type: ROUTINE INSPECTION

Date: 05-AUG-2015

2.40(b)(2)

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

** On the counter in the animal clinic there was a bottle of Flunixinet that was stated to be used within the last month that is past the labeled expiration date of January 2015. Expired drugs may not work as anticipated, could become contaminated, and could harm the animals. The applicant must ensure that all medications used in the facility are not expired. The facility discarded the medication.

2.131(d)(2)

HANDLING OF ANIMALS.

** During the inspection there were several piglets running in and out of the enclosure. The facility stated that they wanted the piglets to be socialized by the public. While the public were coming in contact with the piglets there wasn't an employee or attendant monitoring the public's interactions with the animals. In the petting zoo area there was an employee posted on the giraffe's platform monitoring the feeding station. Down in front of the giraffe's feeding station there was another feeding station for the goats. During the inspection we observed the employee not paying attention to the interactions between the goats and the public while monitoring the giraffes feeding station. A readily identifiable employee or attendant shall be present at all times during periods of public contact so that they can monitor and visualize public contact and, intercede when necessary. There also needs to be enough attendants available to effectively monitor all of the areas where there is public contact with the animals. The facility contained the piglets before the exit briefing.

2.131(e)

HANDLING OF ANIMALS.

** There were young lemurs being housed in a screened-in outdoor enclosure that were stretched out on the bench and floor at about 2 pm. They appeared exhausted by the heat. The temperature was 89 degrees F that day and the heat index was 115 degrees F in the shade. It was the hottest part of the day with a slight breeze. When climatic conditions present a threat to an animal's health or well-being, appropriate measures must be taken to alleviate the impact of those conditions. An animal may never be subjected to any combination of temperature, humidity, and time that is detrimental to the animal's health or well-being, taking into consideration such factors as the animal's age. Correct by the end of the day.

Inspection Report

3.75(c)(3) REPEAT

HOUSING FACILITIES, GENERAL.

** The suspended perch made out of PVC pipe in the golden headed tamarin's night house was dirty and needs to be cleaned more frequent. All surfaces of housing facilities must be cleaned and sanitized when necessary to satisfy generally accepted husbandry standards and practices and to minimize disease.

3.77(a)

SHELTERED HOUSING FACILITIES.

** In the tamarin's night house at the beginning of the inspection the facilities thermostat read 87 degrees F. At the end of the inspection the temperature was 89 degrees F at the zoo. The humidity made it feel hotter and the heat index was 115 in the shade at the park by the end of the inspection. The sheltered part of sheltered housing facilities must be sufficiently cooled when necessary to protect the nonhuman primates from temperature extremes, and to provide for their health and well-being. The ambient temperature in the sheltered part of the facility must not rise above 85 [deg]F (29.5 [deg]C) for more than 4 consecutive hours when nonhuman primates are present, unless temperatures above 85 [deg]F (29.5 [deg]C) are approved by the attending veterinarian, in accordance with generally accepted husbandry practices. The ambient temperature must be maintained at a level that ensures the health and well-being of the species housed, as directed by the attending veterinarian, in accordance with generally accepted professional and husbandry practices. The facility placed a fan in the enclosure that was effective in cooling the sheltered facility.

3.125(a) REPEAT

FACILITIES, GENERAL.

** In "Sadie" the jaguars indoor primary enclosure behind the door there is a stabilizing fencing post that has rusted and is beginning to pit that is part of the containment for the animal. The bottom of the fencing at the junction of the post is also rusted. The rusting of the post compromises the integrity and strength of the structure and needs to be replaced and/or repaired to ensure the containment of the animal.

3.131(d)

SANITATION.

** The hedgehog's den box has an infestation of roaches. When opening the den the roaches were all on the top of the box and down in the animals bedding. It was stated that pest control comes out at least once a week. A safe and effective program for the control of insects may need to be modified and shall be maintained for the entire facility. Pest control had assessed the issues and treated the facility before the exit briefing.

Inspection Report

The previous vet care issue was addressed by the veterinarian and the animals are currently receiving treatment.

The inspection and exit briefing was conducted with the owner.
