Type: ROUTINE INSPECTION
Date: 04-MAY-2023

3.56(b)(3)

Repeat

Sanitation.

The primary outdoor wire enclosure housing three rabbits is located on the ground and the wire is being cleaned only with soap, water, and a rag as needed. The dirt floor of the enclosure is cleaned once a week. The plastic dog house serving as a shelter is not being cleaned nor sanitized. The exterior of the shelter has a layer of dirt and grime on all sides, including the top. The interior of the shelter has a plastic floor with approximately 1/3 of the rear of the floor covered with a mat of feces as wide as the shelter and beginning to go up the interior rear wall. The wire sides and top of the enclosure are not being sanitized since the water used does not reach 180 degrees Fahrenheit and a disinfectant is not being applied.

- When enclosures are not sanitized adequately, there is higher risk of large numbers of germs remaining on the surface which creates a health hazard for the rabbits.
- Primary enclosures for rabbits shall be sanitized at least once every 30 days by washing them with hot water (180 degrees F) and soap or detergent, or by washing all soiled surfaces with a detergent solution followed by a safe and effective disinfectant, or by cleaning all soiled surfaces with live steam or flame.

Inspection Report

Three large round hay bales, used to feed the animals, are kept outside, uncovered in the elements on the compacted dirt ground. The hay bales were found to be universally grey in color with many green clumps of grass growing out the the tops and sides.

- Hay storage, with no protection from the weather such as rain, can cause deterioration and/or contamination of the hay.
- The hay must be stored in such a manner as to prevent deterioration, molding and contamination.

CORRECT BY: AUGUST 04, 2023

This inspection and exit interview were conducted with a facility representative.
