Certificate: **58-C-1052**

Site: 002

EMERALD COAST WILDLIFE REFUGE

Type: ROUTINE INSPECTION

Date: 11-SEP-2014

2.131(c)(1) REPEAT

HANDLING OF ANIMALS.

***The primary enclosure for the wolves, llama's, nilgai, muntjac, wallaby, pig's, fallow deer, axis deer, goat's and cow do not have a barrier fence. These areas are not constantly monitored by a zoo employee, the public can easily get to the enclosure fence and put their hands or other objects through the enclosure.

All enclosures must have a barrier fence that is at least 3 feet from the enclosure on all sides to protect the animals and the public from injury.

3.75(c)(3)

HOUSING FACILITIES, GENERAL.

***The patas monkeys have a tree stump in their enclosure that is covered in green growth indicating that this surface is not readily sanitizable or can not be readily sanitized. Hard surfaces with which nonhuman primates come in contact must be spot-cleaned daily and sanitized to prevent disease hazards. Correct by September 18, 2014.

***The straw bedding in the lemurs dens had insects and bugs crawling throughout it. Contaminated material must be removed or replaced whenever raking or spot cleaning does not eliminate diseases, insects, pests, or vermin infestation. All other surfaces of housing facilities must be cleaned and sanitized when necessary to satisfy generally accepted husbandry standards and practices. Correct by September 18, 2014.

3.125(a)

FACILITIES, GENERAL.

***In the pig's and llama's primary enclosure the shelter located in the back was in disrepair. It is leaning and is not structurally sound. The shelter must be constructed of such material and of such strength as appropriate for the animals involved. The outdoor housing facilities shall be structurally sound and shall be maintained in good repair to protect the animals from injury. Correct by September 18, 2014

***During the inspection there was a pig that walked around the facility. The pig was able to walk under the barrier

Inspection Report

fencing allowing him to walk up to the nonhuman primates enclosures. This pig should be properly contained for its safety and the safety of the nonhuman primates. This animal shall be contained to prevent transmission of disease, minimize public contact and prevent injury. Correct by September 18, 2014.

3.127(d)

FACILITIES, OUTDOOR.

*** Along the perimeter fencing adjacent to the diet facility there was a space approximately a foot from the ground to the bottom of the fencing. There was an overgrowth of foliage and the fencing was rusted and broken at the bottom of the fencing. These areas of deficiency are extensive and the entire perimeter fence should be checked. This space at the bottom of the fencing could allow predators or unwanted animals access to the premises. All outdoor housing facilities must be enclosed by a perimeter fence that is of sufficient height to keep animals and unauthorized persons out. The fence must be at least 8 ft in height. The fence must be constructed so that it protects the animals in the facility by restricting animals and unauthorized persons from going through it or under it and having contact with the animals in the facility, and so that it can function as a secondary containment system for the animals in the facility. Correct by September 25, 2014.

The inspection and exit briefing was conducted with the Conservation Program Coordinator.
