Type: ROUTINE INSPECTION
Date: 26-JUN-2023

2.40(b)(3) Critical

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

A Patagonian Cavy was euthanized due to a fracture leg that was left to heal on its own. Facility representative stated the injury started as a small injury on the lower leg and after it healed when the animal put weight on it the bone protruded through. Veterinary care was not provided after bone was seen. Attempts were made to place the cavy in a travel carrier, but facility was not able to do so and the Attending veterinarian was not contacted. The attending veterinarian came 6 months after the first injury was seen and performed a walkthrough the facility on March 9, 2023. The attending veterinarian recommended that the facility take the Patagonian Cavy to the local veterinarian hospital for diagnostics and possible surgery. The cavy was euthanized at the veterinary hospital. The facility also elected to transfer their Patagonian Cavy population to another licensed facility to better care for their animals. Injuries and any abnormalities seen must be reported to the Attending veterinarian as soon as they are noticed. Daily observation of all animals and direct and frequent communication with the attending veterinarian is required so that care can be provided in a timely matter. Corrected at the time of inspection.

3.75(c)(1)

Housing facilities, general.

The enclosure housing two crab-eating macaques had multiple swing structures that were covered with dry green and black residue consistent with algae and mold. These areas of porous green-black residue make ideal locations for bacteria to collect and grow and can cause disease. The surfaces of housing facilities must be constructed in a manner that allows the surfaces to be readily cleaned and sanitized, or removed or replaced when worn or soiled. Corrected by August 14, 2023.

3.125(a)

Facilities, general.

The enclosure containing one racoon had multiple sharp points in the location where the racoon was resting. The sharp edges were noticed when viewing the racoon resting in an unusual manner. Sharp rusted points were seen directly above and below the racoon. After a few minutes the racoon was able to move unharmed from his resting place. Sharp points can cause injuries and be detrimental to the wellbeing and welfare of the animal. The enclosure must be kept in good repair to prevent the animal from injury. Corrected by September 25, 2023.
