Type: ROUTINE INSPECTION
Date: 24-MAR-2016

2.40(b)(2) DIRECT REPEAT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

****An adult male English Bulldog named "Larry" (MC ID# 4C2A58392D) was sitting in his shelter and was reluctant to come out even with verbal encouragement from the licensee and inspectors. The licensee stated that this dog had escaped his enclosure and was found limping. The dog finally got to his feet with some effort and had a severe limp on his left rear leg as he walked. As much as possible, he did not use the leg as he walked. When standing he would frequently put just his toes on the ground to balance himself to avoid having to put his full weight on that leg. Despite the severity of the lameness, the licensee stated that she intended to just observe the dog and take it to a veterinarian only if it did not improve by the following week.

****A weaned English Bulldog puppy MC ID#0A02593273 had intermittent coughing and wheezing. This puppy had been removed from the heated whelping building the previous week and put into an outdoor enclosure without any bedding even though the ambient temperatures had fallen below 50 degreesF during the day and below 40 degreesF at night during this time period.

Untreated leg conditions can be painful and can worsen with time. Untreated respiratory problems can be painful, can worsen with time, and may be contagious to other dogs. The licensee must have these dogs treated and examined by a veterinarian, must follow the treatment recommendations, and must provide written documentation of vet care and treatment to inspectors upon request. NOTE: The licensee returned the English Bulldog puppy to the heated whelping building during the inspection.

2.50(a)(1) REPEAT

TIME AND METHOD OF IDENTIFICATION.

There was a black, female Pug born on 7/24/2015, also listed in the previous inspection report that did not have official identification. Proper identification of each animal is needed for record keeping and animal traceability. The licensee shall ensure each animal at the facility is officially identified.

Inspection Report

3.4(b)(4)

OUTDOOR HOUSING FACILITIES.

Seven of the outdoor shelter structures had little or no bedding. The outdoor temperature at the time of the inspection was 47.8 degrees F and the National Weather Service recorded the temperature as low as 37 degrees F that morning. A female English Bulldog puppy MC ID# 0A02593273 and a black, female Pug puppy with no official identification had been moved from the climate controlled whelping building to an outdoor enclosure three days prior. The licensee had not provided bedding in their dog house. The English Bulldog puppy (also listed under 2.40b2) had abnormal breathing sounds and coughed repetitively, which could be the result of illness due to lack of acclimation to cold temperatures in conjunction with a shelter that did not have suitable bedding to help keep the puppy warm. Sufficient bedding is needed to help the animals maintain their body temperature. The licensee shall supply clean, dry, bedding material if the ambient temperature is below 50 degrees F and additional clean, dry bedding when the temperature is 35 degrees F or lower. TO BE CORRECTED BY: 3/25/16

Note: At the inspectors request (forecasted low temp 30 degrees F) the licensee and staff returned the Bulldog puppy to the climate controlled facility until its condition could be accessed by a veterinarian and provided bedding in all of the dog houses.

3.6(a)(2)(1)

PRIMARY ENCLOSURES.

The plastic dog house in the female, adult English Bulldog's enclosure named "JD" had sharp, pointed screws that protruded upwards from the base plate edge surrounding the outside of the house. It appeared that the screws had been used to secure the floor of the dog house to the top. The sharp points of the screws are at ground level and easily accessed by the dog." JD " had a small wound on her front right leg that may have been caused by one of the screws. The licensee shall ensure that all primary enclosures are constructed so that they do not have sharp points or edges that could injure the dogs. TO BE CORRECTED BY:3/25/2016

3.6(a)(2)(3) DIRECT REPEAT

PRIMARY ENCLOSURES.

Animals at the facility are not contained securely and repetitively escape from their enclosures. An adult English Bulldog named "Larry" MC ID# 4C2A58392D was limping (also listed under 2.40b2). The licensee stated that Larry had escaped from his enclosure on the night of March 23, by chewing off the metal wires used to secure the gate panel of his enclosure. The inspector found one of the wires on the floor of his enclosure. Animals that are not securely contained in their enclosure can escape, become entrapped or become injured. The licensee must ensure that the enclosures securely contain the dogs.

Inspection Report

This inspection and exit briefing was conducted with the licensee.

Note: The English Bulldog MC ID#00070976CF listed under 2.40b2 of the March 14,2016 inspection report was seen by a licensed veterinarian for diagnosis and treatment and her condition showed improvement.

The un-weaned Pug puppy listed under 2.40b2 of the March 14,2016 inspection report was seen by a licensed veterinarian for diagnosis and is no longer present at the facility.
