Type: ROUTINE INSPECTION
Date: 29-MAY-2019

2.75(b)(1)

RECORDS: DEALERS AND EXHIBITORS.

Upon inspection today, the licensee was unable to provide records or forms that accurately verified the current animals on hand. During the inspection, both the licensee and inspectors had to collaborate and manually count the number of animals for some of the species, including Fallow deer, goats, sheep, and rabbits. The licensee was able to provide an animal census from 2016, but those records had not been updated since then to include newly acquired animals.

Facilities that lack up-to-date records prevent animals from being tracked as they move from one premise to another. This is especially important when there are disease outbreaks and its origin confirmed. Further, an accurate animal census is needed to correctly identify the number and type of species on hand.

Exhibitors shall make, keep, and maintain records or forms that fully and correctly disclose acquired or otherwise owned, purchased, sold, euthanized, or otherwise disposed of by that exhibitor. The records shall include any offspring born of any animal while in his or her possession or under his or her control.

Correct by 6/26/2019.

3.125(a)

FACILITIES, GENERAL.

The small ruminant primary enclosure containing numerous sheep and goats is comprised of chain link fencing. Along one side, the fencing adjacent to the ground had separated from the posts, causing the potential for animal injury or escape. During the inspection, two goats were observed butting against the fence from opposing sides. When the goats pushed against the fence, the bottom of the fence was raised high enough that another animal could easily walk through from either side. Two additional enclosures (llamas and alpacas in one, and camels in another) had sections of wire fence paneling lying on the ground loose within the enclosure.

Fencing that is not in good repair can injure the animals housed if their skin were to get trapped or snagged by the loose fencing. Additionally, gaps within the fence line could prevent proper containment of the animals housed, and

also allow other animals to enter the enclosure. The panels present in the two enclosures could cause entrapment of the legs and/or feet, resulting in trauma or injury to affected extremities.

The outdoor housing facilities must be constructed of such material and such strength as appropriate for the species involved. The facility must have a system of maintenance so that all structures remain structurally sound and in good repair to protect the animals from injury and efficiently contain the animals.

Correct by end of business 6/5/2019.

3.131(a) REPEAT

SANITATION.

A white raccoon enclosure containing two raccoons had piles of increased amounts of excreta on the floor of the enclosure. The licensee stated that he is unable to clean their primary enclosure daily due to the very aggressive nature of both raccoons. Thus, he cleans their enclosure roughly every two weeks, entering when they are sleeping.

The accumulation of excreta can pose health risks to the animals by contaminating the enclosure and attracting unwanted wildlife and vermin that may carry diseases.

The licensee should have a practice in place to ensure husbandry standards are met in accordance with the animal welfare regulations. Excreta shall be removed from primary enclosures as often as necessary to prevent contamination of the animals contained therein and to minimize disease hazards, and reduce odors.

This inspection and exit interview were conducted with the licensee.
