THOMAS & PAMELA SELLNER

Type: ROUTINE INSPECTION
Date: 27-FEB-2017

2.40(b)(2) REPEAT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

A Jacob sheep's front right horn has grown and curled back toward's its right eye. The horn was pushing against the upper eyelid, causing its third eyelid to move out slightly over the eyeball. The third eyelid moving out over the eye is a sign that the horn is pushing against the eyeball. The licensee said they trim horns regularly to prevent this but that it hasn't been completed on the herd this year. Allowing horns to curl back against the sheep's face/head can cause pain and further health problems. The facility must have the attending veterinarian evaluate this sheep's eye and follow the veterinarian's treatment plan. Documentation of the treatment plan needs to be available for future inspections.

3.84(d) REPEAT

CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

An excessive amount of black flies were present in the area where a vervet is housed. Excessive flies in areas where animals are housed can cause disease and spread disease from one animal to another. Ensure that the buildings are maintained in a manner so that there are not excessive flies and that adequate pest control measures are in place.

3.125(a) REPEAT

FACILITIES, GENERAL.

The den area for three kodiak bears has a hole dug out from the the back southeast corner that is big enough that a bear could stick its paw out. Holes underneath enclosure walls could cause animal injury by entrapment or if not corrected promptly could create conditions for animals to escape. Ensure that the areas in and around enclosures are maintained secure and safe at all times.

3.129(a)

FEEDING.

Inspection Report

In the education building, three food bins storing carrots, apples, oranges, and other various produce are stored for animal feed. A mouse was observed in the middle produce bin after lifting the top bin. Rodents such as mice can contaminate feed. Feeding contaminated produce can make animals ill.

Assure that the animals' food is free from contamination. Assure that food is stored in a manner that prevents contamination from vermin.

To be corrected: 3-2-17

3.131(a) REPEAT

SANITATION.

Excessive feces are present in the outdoor enclosure containing four adult raccoons. Two large piles of feces have accumulated in the corners of the enclosure. Feces can produce odors and cause disease hazards that affect animals.

Clean and sanitize the affected areas of the enclosure and repeat often enough to prevent build up.

3.131(d) REPEAT

SANITATION.

An excessive amount of black flies were present in the area where the serval, African crested porcupine, and two coatimundis are housed. (This is the same area where the vervet is housed). Excessive flies in areas where animals are housed could cause disease and spread disease from one animal to another. Ensure that the buildings are maintained in a manner so that there are not excessive flies and that adequate pest control measures are in place.

This inspection and exit interview were conducted with the owner.
