Type: ROUTINE INSPECTION
Date: 24-SEP-2014

2.40(b)(2) DIRECT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

***An adult male Nubian Ibex was observed with excessively long hooves and significant swelling of the front knees. The hooves are approximately three to four inches longer than normal and curling at the ends. The knee joints are rounded and approximately two to three inches in diameter. These conditions have affected the gait of this animal, causing unnatural walking motions. This animal is also observed in less than favorable body condition. The other animals in this enclosure all are in good to excellent condition. The owner stated this animal has previously been treated with antibiotics, dewormed and foot trimmings. Per the owner it has been several months since this animal had been evaluated by a veterinarian. This buck should be evaluated by a licensed veterinarian for diagnosis and treatment. Routine hoof trimmings must be conducted to eliminate excessively long hooves that affect the gait and comfort of the animal. Documentation should be maintained regarding diagnosis and expected treatment programs.

An adult female dromedary camel was observed with a rounded protrusion on the upper left side of the neck, just below the lower jaw bone. This protrusion was approximately four to five inches in diameter and bulbous. At one point this area has an opening with darkened, moist hair surrounding. The attending veterinarian has not evaluated this condition at this time. The owner stated that the mass has increased in size considerably during the last few months. This condition should be evaluated by a licensed veterinarian for proper diagnosis and treatment plan. Documentation should be maintained for review on future inspections. To be corrected by: 10/02/14

This inspection was conducted with the owner on 09/24/14 with the report and exit interview conducted on 09/25/14.
