CAROLYNS COUNTRY COUSINS L L C

Type: ROUTINE INSPECTION
Date: 14-OCT-2015

2.40(a)(1)

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

The facility has a part-time attending veterinarian but had no written program of veterinary care available for review at the time of inspection. It is important for licensees to have and be familiar with written programs of veterinary care to ensure important things such as nutrition and parasite control are provided as directed by the attending veterinarian. The licensee must ensure there is a written program of veterinary care which is followed and available for inspections.

TO BE CORRECTED BY: 23 October 2015

2.40(b)(2)

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

There was one black and white-spotted, adult, female, non-lactating goat which was very thin. Her backbone was highly visible and formed a continuous ridge. When palpated, her lumbar vertebrae were easily grasped between the thumb and forefinger. There was an obvious depression in the transition from her spinous to transverse processes. Her hip bones were very prominent and readily palpable under the skin. Her ribs were also palpable. While the other goats in the enclosure (in better body conditions) foraged around just prior to feeding time, this particular goat went to the corner of the enclosure to lay down, appearing somewhat lethargic. Thin animals could have parasites or other harmful medical conditions. The licensee must have this animal examined by a licensed veterinarian in order to ensure that an accurate diagnosis is obtained and an appropriate treatment plan is developed and followed. The licensee must document this information and make it available to the inspector upon request. The licensee must ensure that all animals receive adequate veterinary care at all times.

TO BE CORRECTED BY: 18 October 2015

3.56(a)(1) REPEAT

SANITATION.

(a) Cleaning of primary enclosures.

Inspection Report

There was an outdoor, bi-level rabbit hutch housing five rabbits on the side of the barn, separated from the rest of the animals and Bunnyville. The enclosure had an excessive amount of excreta resulting in more feces than bedding on the floor of the bottom layer. All five bunnies were observed walking on the feces while foraging for food. The fecal pellets were so numerous that they had spilled out the front of the enclosure resulting in an accumulation of pellets just outside the enclosure. A build up of feces poses a health risk for the animals. The licensee must ensure that the rabbit enclosures are kept reasonably free of excreta by periodic cleaning. This non-compliant item was corrected at the time of inspection.

The inspection was conducted on 14 October 2015 with a facility representative. The exit interview was conducted on 16 October 2015 with a facility representative.
