Type: ROUTINE INSPECTION
Date: 20-OCT-2016

3.1(c)(1)(i) REPEAT

HOUSING FACILITIES, GENERAL.

The metal pipe under the entrance gate to one enclosure is rusted to the point that there are now jagged edges present. The lower metal pipe between two enclosures is also rusted to the point that there are now jagged edges present and a complete section is missing.

The lower section of one metal food receptacle is rusted resulting in a hole through this section and producing jagged edges.

Rusted surfaces cannot be adequately cleaned and sanitized and can affect the structural strength of the material. All surfaces must be constructed in a manner that allows them to be readily cleaned and sanitized and remain structurally sound.

3.9(b) REPEAT

FEEDING.

There is still at least one metal "self-feeder" that has a buildup of food residue and grime on the interior in contact with the food. In the "bowl" part of this feeder was some moldy feed. Dirty food receptacles can contaminate the food and affect the nutritive value of the food. If self-feeders are used, the licensee must keep them clean and sanitized in accordance with 3.11 b.

3.11(a) REPEAT

CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

According to the owner, feces were last removed from the outdoor housing facility 3 days ago. In two of these enclosures a large portion of the floor area was covered by excreta. Also, excreta covered approximately one-third of the outdoor section of the sheltered whelping enclosure. This was last cleaned two day ago.

Accumulation of excreta can soil the dogs, increase disease transmission, and attract flies and other pests. Excreta and food waste must be removed from primary enclosures on a daily basis or more often to prevent the soiling of the dogs in the enclosure.

3.11(b)(2)

Inspection Report

CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

There are at least 5 water receptacles that have some brown residue in the bottom and some green algae growing along their sides. Water receptacles that are not kept clean can contaminate the water and impact the dogs willingness to drink. All water receptacles must be cleaned and sanitized at least once every two weeks, or more often if necessary to prevent an accumulation of dirt, debris, food waste, excreta and other disease hazards. Correct by 21 October 2016.

3.11(d)

CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

There were mouse droppings observed on the concrete floor under one food receptacle. These mice were attracted to the food that had fallen through the hole in the bottom of this food receptacle. Mice can transmit diseases to the dogs. An effective method of pest control must be established and maintained to reduce pest infestation. Correct by 27 October 2016.

This inspection and exit interview were conducted with a facility representative.
