### 3.127(d)

#### Facilities, outdoor.

A raccoon, an eastern fox squirrel, and two red foxes housed in outdoor enclosures are not adequately protected by a perimeter fence. At the time of the inspection, a raccoon was housed in an outdoor falconry mews. The north, south, and west walls of mews were solid wood, but the east side was covered with heavy mesh screen. The mews was not surrounded by a perimeter fence. In addition, the eastern fox squirrel and the 2 foxes were housed in outdoor enclosures about 20 yards from each other. A 6-feet-high wire panel perimeter fence enclosed about ¼ of the area around these two enclosures. Perimeter fencing is important to protecting the animals at the facility from injury and disease. Perimeter fences can keep unwanted animals and unauthorized people from having unwanted contact with the animals at the facility. Perimeter fences can also serve as a secondary containment system for the animals.

Outdoor housing facilities must be enclosed by a perimeter fence that is of sufficient height (6 feet) to keep animals and unauthorized persons out. The fence must be constructed so that it protects the animals in the facility by restricting animals and unauthorized persons from going through it or under it and having contact with the animals in the facility, and so that it can function as a secondary containment system for the animals in the facility. It must be of sufficient distance from the outside of the primary enclosure to prevent physical contact between animals inside the enclosure and animals or persons outside the perimeter fence. Such fences less than 3 feet in distance from the primary enclosure, and less than 6 feet high, must be approved in writing by the Administrator.

To be corrected by May 31, 2025.

This inspection and exit interview were conducted with a facility representative.
