Type: ROUTINE INSPECTION
Date: 22-MAR-2016

2.40(b)(2)

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

The black and white rabbit, in an area restricted to the public, was being treated for an eye condition with terramycin. The rabbit had some dried matter, yellow grey in color, below each eye. The eyes were not swollen or red. An employee was asked to roll out the lower eyelid. The conjunctiva and third eye lid were examined and found to be somewhat swollen, red and irritated. The owner stated they had been treating the eye condition for about a week and it had greatly improved. Although improved the treatment plan has not cured the condition. Treatment was being administered by the owner without written instructions and without examination by the attending veterinarian. Eye aliments can be very painful and problematic. This rabbit needs to be evaluated by the attending veterinarian.

Correct by: within 24 to 48 hours.

Two guinea pigs had been treated with lotrimin, by the owner, for a suspected fungal skin problem. The guinea pigs looked well and the skin condition had responded well to the treatment. The owner stated their attending veterinarian had prescribed this treatment for this problem in the past. However, there was no written prescription or protocol for its use by the attending veterinarian. All off-label drug use must be approved by the attending veterinarian and must have written instructions in place to ensure proper medical treatment is being administered.

Correct by: Ensure all medical treatment is approved in writing by the Attending Veterinarian from this point forward.

3.29(a) DIRECT

FEEDING.

One enclosure housing a single guinea pig had no food or water receptacles, and had no food or water in the enclosure. The owner stated the guinea pig had been placed in this new enclosure the day before this inspection,

Inspection Report

about 24 hours ago. Guinea pigs must be fed each day; this animal had gone a full day without food or water. The licensee put food and water in the enclosure immediately upon discovering it during the inspection.

Corrected during inspection.

3.30 DIRECT

WATERING.

One enclosure housing a single guinea pig had no food or water receptacles, and had no food or water in the enclosure. The owner stated the guinea pig had been placed in this new enclosure the day before this inspection. Unless food supplements consumed by guinea pigs supply their water requirements, water must be provided daily. Water is essential for all animals and daily monitoring of water in all guinea pig enclosure is necessary. Dehydration and deteriorating health conditions can happen quickly if water is not available. Monitoring of water levels needs to be increased to insure all animals have adequate water supplies. Water was provided during this inspection.

Corrected during inspection.

3.56(a)

SANITATION.

The top cage containing two rabbits, next to the porcupine cage, has an accumulation of old bedding, food, fur, and cobwebs between the cage and the wall. The back panel of the cage has an accumulation of cobwebs. This needs to be cleaned to comply with USDA sanitation regulations and to prevent the possible growth of mold and bacteria or attraction of pest such as flies, roaches, or mice. A regular schedule of cleaning around and behind cages needs to be in place and followed.

Correct by: March 25, 2016

3.58(a)

CLASSIFICATION AND SEPARATION.

One rabbit was housed in the same enclosure with two guinea pigs. A second rabbit was housed with one guinea pig in another enclosure. USDA regulations state that rabbits shall not be housed with any other species of animal.

Inspection Report

Rabbits are a prey species and housing with other animals can produce physical stress on the rabbits which may affect overall health. Also, rabbits are severely affected by some types of bacteria that are carried unnoticed by other species.

The rabbits were separated from other species by moving them to other cages at the time of the inspection.

Corrected during inspection.

3.125(c) REPEAT

FACILITIES, GENERAL.

In the food storage area several food bags were opened and taped shut. While this may help keep the food fresh it does not protect the food from vermin such as mice from chewing into the bag. All open bags of food need to be stored in such a manner to protect them from mold, deterioration, and vermin contamination. Containers for open bags of food material need to be used and maintained in good condition to protect food quality.

Correct by: March 25, 2016

3.130 DIRECT

WATERING.

One enclosure housing five degus had a empty water bottle. Water must be provided at all times or as frequently as necessary depending on the age, size, condition, and species of animal. Water was provided during the inspection and the degus mobbed the water bottle and drank for several minutes indicating they were very thirsty. Water is essential for life and all animals must have access to it. Monitoring of water levels needs to be increased and employees need to make sure all water bottles have adequate levels of water for each enclosure containing animals.

Corrected during inspection.

3.131(c) REPEAT

SANITATION.

The floor beside and behind the Kinkajou cage has an accumulation of old bedding, dry food biscuits, and food

Inspection Report

materials. Also the floor in the food storage area under the food bin racks has an accumulation of spilled dry food materials on the floor. This needs to be cleaned up to prevent the attraction of pest and possible growth of molds and bacteria. A regular schedule of cleaning around and behind the cages and food storage bins needs to be in place and followed.

Correct by: March 25, 2016

An exit interview was conducted with the facility owner at the end of this inspection.
This inspection was conducted with USDA VMO, Dr. Gwynn Hallberg.
