Type: ROUTINE INSPECTION
Date: 29-JUL-2015

2.40(b)(2) DIRECT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

An English Bulldog, microchip number 0A0234510, was observed with a protrusion of tissue from the medial corner of the right eye. This protrusion was approximately one quarter inch in diameter and reddened. Crusty tannish material clung to the lashes and lids of this eye. The left eye had an accumulation of greenish material covering approximately half of the area of the cornea. The owner stated this dog had undergone entropion surgery on both eyes during March with the protrusion of tissue appearing within the last couple of weeks. She stated she had not been in contact with a licensed veterinarian regarding this condition recently but she was cleaning the eyes regularly. This protrusion of tissue may cause severe discomfort and stress to this dog as well as increased risks of infection. A licensed veterinarian must be consulted for an evaluation of this condition. Documentation must be maintained to outline the treatment program approved by the veterinarian.

An English Bulldog, microchip number 0A01776968, was observed with feet with thickened, reddened skin. The pad circumference of the feet appear to be at least 50 greater than normal. The skin is reddened around the toes and extending upwards the leg a short distance. On the left front foot an opening in the skin surface was located the first and second digits from the outside. The hair in these areas is thinned. The bottom of the feet have been significantly affected with individual toe pads not readily identifiable due to the thickening and swelling of the tissues. No apparent lameness or distress was observed during this inspection. The owner stated the attending veterinarian had examined this dog on June 19, 2015. This condition at that time was identified as a foot infection with a treatment program of antibiotics prescribed. The owner stated she had followed with a 10 day treatment program of penicillin. At this time, approximately 4 weeks since the last treatment, the owner states that there has not been a great improvement in this condition. No further communication with a licensed veterinarian has taken place since regarding this dog. This condition may cause extreme discomfort and stress to this dog as well as risking the health and well being of animal. This dog must be evaluated by a licensed veterinarian for further diagnoses and prognosis. Documentation must be maintained for review by the inspector of findings and treatment programs.

To be corrected by: 07/31/15
