Type: ROUTINE INSPECTION
Date: 26-JUL-2022

3.75(c)(3)

Housing facilities, general.

The facility's current cleaning frequency did not effectively eliminate the accumulation of feces and insect activity. The feces was producing strong odors and attracted large groupings of flies that then could be seen within food bowls. The facility must increase their cleaning frequency to reduce the accumulation of feces and odors that attract insect pests. Additionally, accumulations of feces can present disease hazards to the health and well-being of the nonhuman primates. Correct by August 5th, 2022.

3.78(d)

Outdoor housing facilities.

The perimeter fence was not structurally intact at the time of inspection. The back portion of the fence had been removed to allow for construction of a new enclosure. Additionally, an enclosure had been constructed less than 3ft away from the perimeter fence. A perimeter fence that is not maintained in good repair can allow unwanted animals and persons to enter the facility and potentially harm the nonhuman primates within. The perimeter fence must be constructed so that it protects the nonhuman primates in the facility by restricting unauthorized humans, and animals the size of dogs, skunks and raccoons from going through it or under it and having contact with the nonhuman primates.

Correct by August 12th, 2022.

Inspection Report

3.84(c)

Cleaning, sanitization, housekeeping, and pest control.

At the time of inspection, the vegetation adjacent to the perimeter fencing on one side of the property was overgrown and obscured the lower portion of the fence. This made it difficult to walk the perimeter fence and confirm if the fence was structurally intact. Housing facilities must be free of any accumulation of weeds. The vegetation along the perimeter fence should be managed so that the fencing can be checked for structural deficiencies or evidence of pest activity. Additionally, overgrowth of vegetation may harbor pests.

Correct by August 5th, 2022.

3.84(d)

Cleaning, sanitization, housekeeping, and pest control.

There was an excessive presence of insect pests in and around animal enclosures. The insects were congregating on accumulations of animal feces and in food bowls. Insect pests can carry parasites and various diseases that could compromise the health and well-being of nonhuman primates. Although the facility does spray for pests on the opposite side of the property (where no regulated species reside), there were no other additional measures being used for pest control. Licensees are responsible for establishing and maintaining an effective program for controlling pests so as to promote the health and well-being of the animals and reduce contamination by pests in animal areas.

Correct by August 5th, 2022.

This inspection and exit interview were conducted with the facility representative.
