DAWN & ROBERT TROUPE

Type: ROUTINE INSPECTION
Date: 18-FEB-2015

2.40(b)(2) REPEAT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

- In the sheltered facility, "Ziggy," an 8 year old dappled Dachshund male (ID # 0A01705230) had an excessive buildup of a dark brown material on the teeth extending up into the gum line. Most of the teeth could not be visualized. The gums were swollen and reddened. There was a yellow, creamy material along the gum line near one of the large cheek teeth on the right side (the large carnassial tooth). The buildup of abnormal material on teeth with a discharge at the gum line can be painful, impact the ability of the dog to eat normally, and harm the health of the animal. The licensee must have this animal examined by a veterinarian to obtain an accurate diagnosis and appropriate treatment plan. The outcome of this consultation must be documented and provided to the inspector upon request. The licensee must ensure that all animals receive adequate veterinary care at all times.

- In the sheltered portion located behind the licensee's home a red female Chow Chow named, "Pearl" had a clear discharge surrounding and draining from both eyes and down her face. The discharge completely circled each eye and ran down her face toward the muzzle. The licensee stated that Pearl's eyes had been that way since she was a puppy but no documentation could be provided from the attending veterinarian indicating a pre-existing condition. Eye discharge can occur due to infection, allergies, injury, irritation or other medical conditions that could be painful. The licensee must have this animal examined by a veterinarian to obtain an accurate diagnosis and appropriate treatment plan. The outcome of this consultation must be documented and provided to the inspector upon request. The licensee must ensure that all animals receive adequate veterinary care at all times.

- One outdoor enclosure contained three adult Scottish Terriers, two females and one male. One black female named, "Teddy Bear" appeared to be very sore and stiff when trying to walk. This could be an indication of an altercation between one or more of the other dogs in the enclosure or be an indication of health issues. Teddy Bear also had fecal material coating her bottom area indicating a quick release of feces associated with fear or intimidation from another dog or diarrhea. The stiff, sore posture indicates a health issue and the underlying cause must be determined and addressed. If the diagnosis is soreness due to fighting then the social hierarchy of this group does not accommodate these two particular females with this particular male. The licensee must take this animal to a veterinarian and determine the underlying problem and observe and establish appropriate compatibility between mating pairs in order to prevent future injury and maintain compatible groups at all times.

Inspection Report

RECORDS: DEALERS AND EXHIBITORS.

- Official USDA dog on hand sheets (7005's) did not have a complete listing of all dogs on the premise. When the records and dogs at the facility do not match it makes the records incomplete. Complete and accurate records are needed to ensure each animal's identity can be known with certainty and to facilitate the ability to trace dogs. The licensee must maintain records which fully disclose all information concerning each dog in their possession. The licensee must maintain complete and accurate records of all dogs at all times at their facility.

3.11(a)

CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

- In the sheltered enclosure with concrete runs there was an excess buildup of animal waste covering 40-50% of the concrete runs and 5-10% of the indoor portion and bedding. The licensee stated that the solid waste had been removed four days prior to the inspection. Fecal waste buildup reduces available floor surface area that the dogs have access to. Animal waste collecting under and around dogs creates an unsanitary condition and could lead to potential disease or health risks for the dogs. The potential for increased insect and pest infestation exists when animal waste is not removed in a timely manner. The potential for respiratory problems exist when the dogs are subjected to the continual smell of animal waste that is collecting under and around them. Removal of animal waste from the runs and inside the sheltered facility must occur daily to prevent an excessive accumulation that could cause soiling of the dogs contained in the primary enclosures and to reduce disease hazards, insects, pests, and odors. The licensee must ensure that all excreta is removed from the primary enclosures on a daily basis.
