Type: ROUTINE INSPECTION  
Date: 16-FEB-2017

### 2.40(b)(2)

#### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

Male, brindle and white, Shih Tzu ("Buddy" DOB 1-07) with chip 107 292 875 has white color to the interior of this eye. The surface of the eye (cornea) has areas of dark discoloration. The licensee reports this dog has been evaluated by the attending veterinarian and is currently receiving medication which she is able to show the inspector. The medication is ofloxacin drops that expired 12/16. The licensee is unable to produce documentation to show when the dog was evaluated or that the treatment has been prescribed by the veterinarian. Eye problems can be a result of infection, trauma, and a variety of other medical problems and be painful. Medication that is being used without direction from the attending veterinarian can be used incorrectly and produce unwanted side effects.

Female, cream colored Pekingese ("Blondie" DOB 12-09) with chip number OAO2223563 has thickened ear tissue obscuring the opening of both ear canals. There is dark, moist debris in and around the left ear. The licensee has documentation showing that this dog was evaluated by the attending veterinarian on 10-4-15 and is able to show the "baytril mix" solution that was prescribed and that she continues to get from the veterinarian to use on this dog. The dog continues to have ear problems which can be painful and needs to be re-evaluated by the veterinarian. The dog also has an uneven surface and dark pigment along with some green colored discharge on the surface of the left eye (cornea). Eye problems can be a result of infection, trauma, and a variety of other medical problems and be painful.

Female, red and white Shih Tzu ("Jessie" DOB 1-05) with chip number 074 889 629 has recessed gums around the lower right incisor teeth. There was hair caught around these teeth and along the gum line of the upper right premolar teeth. There is thick dental tartar on the upper premolar and molar teeth. The gums are recessed away from the surface of the upper right premolar teeth. Dental disease can cause damage to the gum tissue, to the tooth and mouth structures, can be painful, and can impact the ability of the dog to eat normally, affecting the overall health of the animal.

The animal listed above must be examined by a licensed veterinarian in order to ensure that an accurate diagnosis is obtained and an appropriate treatment plan is developed and followed. This information, including the diagnosis, treatment and resolution of the condition, must be documented and made available to the inspector upon request. These animals must be evaluated by a veterinarian by 21 February 2017.

## Inspection Report

---

### 3.1(e)

#### HOUSING FACILITIES, GENERAL.

There is an open bag of food and a bucket without a lid containing food that is being stored in the food storage shed. This food was covered by a tarp but was not being stored in a leak-proof container with a tightly fitting lid. Open containers of food will attract pests and can lead to the contamination of the food. The licensee must ensure that all open supplies of food and bedding must be kept in leak-proof containers with tightly fitting lids to prevent contamination and spoilage. To be corrected by 18 February 2017.

This inspection and exit interview were conducted with the facility representatives.
