Type: ROUTINE INSPECTION
Date: 11-JUN-2025

3.75(c)(1)(i)

Housing facilities, general.

Multiple primary outdoor enclosures housing capuchins contained rusted wire paneling that were beginning to show signs of wear and/or degradation. Additionally, an enclosure housing seven capuchins contained a metal pole along the bottom of the enclosure that was rusted through and created a large hole in the pole. Rusted primary enclosure materials can lose structural integrity over time and cannot be properly cleaned and sanitized. Excessive rust in surfaces where animals have daily contact with can lead to injury and make the sanitization process difficult. Any surfaces that come in contact with nonhuman primates must be free of excessive rust that prevents the required cleaning and sanitization, or that affects the structural strength of the surface. Correct by August 11, 2025.

3.80(a)(2)(i)

Primary enclosures.

The primary enclosure housing seven capuchins contained a large chicken wire patch at the bottom that was in disrepair. Numerous sharp points were extending upward around the perimeter of the patch. These sharp points were easily accessible to the animals and posed a risk of injury. Primary enclosures must be constructed and maintained so that they have no sharp points or edges that could injure the nonhuman primates. All primary enclosures for nonhuman primates must be constructed and maintained in good repair. Correct by June 20, 2025

This inspection and exit interview were conducted with the licensee.
