HOLE N' THE ROCK

Type: ROUTINE INSPECTION  
Date: 28-JUL-2016

### 2.40(b)(2) DIRECT

#### ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

A 7 year-old, male fallow deer was observed to have a partial weight bearing lameness of the right hind limb with a severely overgrown, cork-screw shaped hoof. Discussion with the attending veterinarian and veterinary records review indicate that the deer sustained a severe injury to its right hind limb due to being caught in a fence on 03/05/2014. The attending veterinarian stated he is currently aware of the overgrown hoof however he does not recommend hoof trimming at this time due to the stress of sedating this animal in the high, summer temperatures. According to records, the deer has not received any pain relieving medications or treatments for its chronic lameness condition.

Lameness along with severely, overgrown hooves often indicates pain and discomfort to the animals. Although this animal has been examined by a veterinarian, there is currently no treatment plan in place to address any associated pain or discomfort resulting from its condition.

The licensee must obtain an evaluation of this animal's current condition by a veterinarian which includes an appropriate treatment plan for the issue cited above. The outcome of this consultation must be provided to the inspector upon request, as well as a documented plan which addresses hoof care and ensures the relief of any pain/discomfort. Additionally, any medications prescribed along with the dosing instructions, and entries on a log and/or calendar and/or animal health record that list when the medication is administered to the animals should be included along with any follow-up instructions.

### 3.125(a)

#### FACILITIES, GENERAL.

Goat enclosure: There was a wooden picnic table in disrepair with several protruding nail heads and sharp, nail points. Also, there was an ice chest on top of this table with torn, plastic sides exposing two sharp, metal screws and underlying foam material. Any foam-type objects may pose a risk of foreign body ingestion to the animals.

## Inspection Report

---

Sheep enclosure: The wire fencing material in several areas of this enclosure had sharp points turned up and protruding into the enclosure.

Zebra enclosure: There were a few metal livestock fence panels in disrepair resulting in protruding, sharp, metal points/wires into the enclosure.

Sharp, protruding points or edges in areas of contact with the animals may lead to injury. All enclosures must be kept in good repair and free of sharp points, protruding edges or other hazards in order to protect the animals from injury and properly contain the animals. A system of timely identification, facility repair and maintenance must be in place.

Correct by 08/28/2016

Exit interview was conducted with a facility representative.
