Type: ROUTINE INSPECTION
Date: 30-AUG-2017

2.40(b)(2) REPEAT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

An adult female Boxer (m/c 965000000367964), had a bleeding, open wound at the base of her left ear. The owner had not noticed the wound and it had not been treated although the helper said that he saw it a few days ago and sprayed some "blue stuff" on it. The owner stated that it was fly strike and sprayed Vettricyn on it during the inspection.

Summer, an Olde English Bulldog (m/c 900049000504739), had a bleeding, open wound with a gray discharge at the base of her left ear. The owner had not noticed the wound and it had not been treated. The owner stated that it was fly strike and sprayed Vettricyn on it during the inspection.

Tommy, a male Yorkshire Terrier (m/c 048-564-627), had thinning hair on his chest, around his eyes, and the top of his head. Numerous fleas were observed on the belly and face. There also was an open wound at the base of his left ear.

Gizmo, a male French Bulldog (m/c 0A02581453), was observed to have frequent episodes of repeated coughing and gagging. While being observed, he coughed up a white foamy discharge. The owner stated that the dog had been doing this for almost a week. There had been no consultation with a veterinarian for diagnosis and treatment.

Untreated or inappropriately treated wounds and cough may be painful and may worsen with time. The owner must consult a veterinarian about these conditions and treat the dogs appropriately. Documentation of these medical conditions, their treatment, and their outcome must be made available to APHIS officials upon request.

3.11(d) REPEAT

CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

Inside the shelter buildings there were 3 enclosures that had excessive flies in them. Two outdoor enclosures were observed to have excessive flies. Flies can spread disease that can affect the health of the dogs. One dog was observed to have numerous fleas on his face, belly, legs and head. Flea bites irritate the dogs' skin and can cause and spread disease. The owner must establish and maintain an effective pest control program.
