Type: ROUTINE INSPECTION
Date: 01-AUG-2016

2.40(b)(2) REPEAT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

The program of veterinary care form states that the arctic foxes are to be treated monthly with Frontline for ectoparasites. The licensee has other written instructions from the attending veterinarian as of 25 May 2016 to use NexGard for the foxes for flea control at least through August. The licensee states that one arctic fox was treated with NexGard at the time it was recommended in May but has not been given the NexGard or Frontline since. Failure to follow the program of veterinary care and other written directions from the attending veterinarian can result in a variety of medical and husbandry problems for the animals. The licensee must use appropriate methods to control, diagnose, and treat diseases and injuries as directed by the attending veterinarian.

3.75(c)(3) REPEAT

HOUSING FACILITIES, GENERAL.

The resting surfaces, climbing ladders, and some spots on the walls in two sheltered capuchin enclosures were still visibly soiled. The licensee states that these were last sprayed clean about 2 weeks ago. There was also an accumulation of feces in the indoor section of one sheltered black-and-white lemur enclosure. The licensee states the feces were last removed from this enclosure two days ago. Failure to clean hard surfaces with which nonhuman primate come into contact can result in odors, attraction of pests, and general unsanitary conditions and can also play a role in disease transmission. The licensee must ensure that all hard surfaces that nonhuman primates come into contact with are spot cleaned daily and sanitized in accordance with 3.84 of subpart F to prevent accumulation of excreta or disease hazard. If species scent mark, the surfaces must be sanitized or replaced at regular intervals as determined by the attending veterinarian in accordance with generally accepted professional and husbandry practices.

3.77(a)

SHELTERED HOUSING FACILITIES.

The sheltered portion of three sheltered buildings housing non-human primates had ambient temperatures above 85 degrees F as measured by the inspector's kestrel thermometer for more than 4 hours during the inspection.
-The "snow" building had the following ambient temperatures in degrees F: 89.6- 90.0 at 1:33 pm; 91.6 at 2:56 pm; and 91.9 at 6:23 pm.

Prepared By: KENDALL LUNDY, A C I USDA, APHIS, Animal Care

Inspection Report

-The "capuchin" building had the following ambient temperatures in degrees F: 88.8 at 1:42; 91.2 at 3:03 pm; and 93.1 at 6:27pm.

-The "colobus" building had the following ambient temperatures in degrees F: 87.7 at 1:52 pm; 87.1 at 3:09 pm, and 88.2 at 6:32.

Inability to protect the nonhuman primates from temperature extremes can result in discomfort for the animals and inability to maintain a safe body temperature. The licensee must ensure that the sheltered housing facilities be sufficiently heated and cooled when necessary to protect the nonhuman primates from temperature extremes. The ambient temperature in the sheltered part of the facility must not rise above 85 degrees F for more than 4 consecutive hours when nonhuman primates are present unless temperatures above 85 degrees are approved by the attending veterinarian. Correct by 7 August 2016.

3.81(c)(4)

ENVIRONMENT ENHANCEMENT TO PROMOTE PSYCHOLOGICAL WELL-BEING.

There is an individually housed Pata's monkey in a sheltered housing at the facility. The environmental enhancement plan written by the licensee states that the Pata's monkey will be housed in pairs. There are no special considerations in the environmental enhancement plan to address the needs of this individually housed animal. The licensee must ensure that the environmental enhancement plan outlines the special attention regarding the enhancement of the environment of individually housed nonhuman primates that are unable to see and hear nonhuman primate species of their own or compatible species. Correct by 1 Sept. 2016.

3.127(c) REPEAT

FACILITIES, OUTDOOR.

The area around the water receptacle for the zebras is covered with mud and standing water. These animals cannot approach the water receptacles without walking through the mud and standing water. Standing water and mud can also attract pests and can lead to an increase in disease transmission. A suitable method must be established to rapidly eliminate excess water.

This routine inspection was conducted on 1 Aug. 2016 with facility representatives as well as Dr. Margaret Shaver, VMO and Kendall Lundy, ACI

The exit interview was conducted with a facility representative on 2 Aug. 2016.
