Type: ROUTINE INSPECTION
Date: 08-MAR-2023

2.40(b)(2)

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

Five bottles of medication (Safeguard© dewormer, Penicillin, Vit B Complex, Amikacin, BNP eye ointment) were expired (date range 2014-2022) and comingled with non-expired medications ready for use. Expired medications could cause harm if used or be ineffective for treatment causing or worsening illness in the animal. Appropriate methods, which include using only unexpired medications, to prevent, control and treat diseases or injury should be provided to the animals. To be corrected by: 3/15/2023.

2.131(c)(1) Critical

Handling of animals.

On 2/25/23 at approximately 1 pm, during public exhibition, a two-year-old child was bitten on the left hand by a pig that is white with black patches. The child was treated by a physician for the bite and the bite was reported to the County Health department on 2/27/23. There were no barriers or attendants present at the time of the incident. Animals publicly exhibited must be handled so there is minimal risk of harm to the animal or the public. Unsupervised animal public contact can result in harm to the animal or public. During public contact, a responsible, knowledgeable, and readily identifiable employee must be present to minimize the risk of harm to the animal or public and animals shall be handled in a manner to minimize risk humans and animals. To be corrected by: 3/15/2023.

Inspection Report

3.28(a)(1)

Primary enclosures.

The unsealed wooden enclosure housing 27 guinea pigs (adults and juveniles) showed staining and warping as evidence of prolonged wetness at and below the level of the shavings. This could prevent adequate cleaning and sanitation of the enclosure resulting in ill health or disease or unsafe conditions. Primary enclosures for guinea pigs should be constructed of smooth material substantially impervious to liquids and moisture.

To be corrected by 4/15/23.

3.125(c)

Facilities, general.

In the food prep area, the tops of both refrigerators containing animal food stuffs were being used to store cleaning products.

All 7 large, wheeled garbage type bins used for storing open bags of animal feed had their lids flipped behind them exposing the food to contamination.

An opened bag of shavings was stored directly on the floor in the food prep area.

Improperly stored cleaning products & bedding and uncovered feed containers can result in contamination or degradation of animal feed or infestation by pests and vermin, and cause illness or harm to the animals.

All supplies of food and bedding shall be stored in ways which protect against deterioration, molding or contamination by vermin and pests.

To be corrected by: 3/15/23

3.131(a)

Sanitation.

Inspection Report

The front mesh on an enclosure containing 4 fruit bats was crusted with built-up food debris.

The hammock in the Kinkajou enclosure was dirty and soiled.

Food waste and soiled housing items can cause illness or disease in animals.

Food waste and excreta shall be removed from primary enclosures, and housing items cleaned or replaced as often as necessary to prevent contamination of the animals and minimize disease hazards and reduce odors.

To be corrected by 3/31/23.

3.131(d)

Sanitation.

A multitude of flies were swarming about the food prep area: on cutting boards, in the open garbage can, and in food dishes being prepped. A kinkajou housed near the food prep area had several flies present in its cage. A full fly strip was hung in the food prep area. Fly spray is used in other areas of the building but not in the food prep area. Pest control methods are not sufficient to maintain pests at an acceptable level in the food prep area. Flies can carry and spread disease and contaminate food and surfaces causing illness and disease in animals.

A safe and effective program for control of insects and pests must be established and maintained.

To be corrected by 3/31/23.

This inspection and exit interview were conducted with facility representative.
