Type: ROUTINE INSPECTION

Date: 06-SEP-2023

3.131(d)

Sanitation.

The facility does not have a pest control program for burrowing mammals and insect pests. There was a large quantity of live small, red beetles present in and under the feed trough for four elk. Also around the feed trough and shelter structure are at least 5 holes in the ground that range from approximately 6-12 inches in diameter, likely made by a mammalian pest. The facility representative stated they were unaware of these pests being present in the elk enclosure and do not have a pest control program for insects or burrowing mammalian pests. Beetles and other insects may cause disease hazards and discomfort to the animals. The mammalian pest burrows may cause injury to the animals if an elk were to step into a hole or burrow.

A safe and effective program for the control of insects, ectoparasites, and avian and mammalian pests shall be established and maintained.

To be corrected by: 22-September-2023

This inspection and exit interview were conducted with facility representatives.
