

Inspection Report

HL's Menagerie
13900 Stirling Rd
Southwest ranches, FL 33330

Customer ID: **6017669**
Certificate: **58-C-1285**
Site: 001
HL's Menagerie

Type: ROUTINE INSPECTION
Date: 28-AUG-2025

2.1(b)(2)(i)

Requirements and application

The facility has exceeded the maximum number of animals allowed under their license. The facility is approved for up to 100 animals, but 125 animals were documented during the inspection. The USDA license authorizes a specific number of animals to ensure that the facility and personnel possess adequate facilities, employees and education to provide sufficient husbandry to the regulated animals. A licensee must obtain a new license before any change resulting in more than the authorized number of animals on hand at any single point in time during the period of licensure. The licensee must reapply for a license that properly reflects the number of regulated animals under the license or reduce the number of regulated animals to a number which is under the maximum threshold authorized under the current license. To be corrected by September 30, 2025.

2.40(a)(1)

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

The facility does not have an updated Program of Veterinary Care form. A facility representative stated that a new part-time attending veterinarian was acquired and that no site visit has occurred within the past year. Formal arrangements have not been documented in the Program of Veterinary Care, and the form has not been updated. A written Program of Veterinary Care is necessary to facilitate communication between the attending veterinarian, the on-site animal care staff, and the facility owner. It also ensures animals will receive consistent and timely veterinary diagnoses and treatment of diseases, illnesses, and injuries. The formal arrangements with a part-time veterinarian shall include a written Program of Veterinary Care and regularly scheduled visits to the premises. Correct by September 18, 2025.

3.78(d)

Outdoor housing facilities.

The facility, which houses primates in outdoor enclosures, does not have an adequate perimeter fence. Multiple areas of the perimeter fence are less than 6 feet tall. An insufficient perimeter fence can allow unwanted animals or people to enter the facility and potentially harm the animals within. The perimeter fence must be constructed so that it protects nonhuman primates by restricting unauthorized humans, and animals the size of dogs, skunks, and raccoons from going through it or under it and having contact with the nonhuman primates. It must be of sufficient height (at least six feet high) to keep unwanted species out. It must be of sufficient distance (at least three feet) from the outside wall or fence of the primary

Inspection Report

enclosure to prevent physical contact between animals inside the enclosure and outside the perimeter fence. Correct by September 30,2025.

3.84(c)

Cleaning, sanitization, housekeeping, and pest control.

The kitchen was unclean and in disorder. At the time of inspection, unwashed dishes were present in the sink, countertops were dirty and cluttered, and trash and debris were observed inside lower cabinets and in corners. Storage shelves were disorganized, and crumbs and debris were present on the floor. Dirt and grime were also observed on food storage containers. This accumulation of clutter and debris attracts vermin and interferes with proper husbandry practices. Premises must be kept clean and in good repair in order to protect the animals from injury and to promote proper husbandry and maintenance of the facility. Correct by September 4,2025.

3.127(d)

Repeat

Facilities, outdoor.

The facility, which houses a sloth, genets, kangaroos, wallabies, kinkajous and porcupines in outdoor enclosures, still does not have an adequate perimeter fence. Most of the premises is surrounded by a perimeter fence that is less than 6 feet tall. A perimeter fence protects animals from contact with unauthorized people and animals. A perimeter fence also acts as a secondary containment system if an animal escapes from its primary enclosure.

An outdoor housing facility must be enclosed by a perimeter fence that serves as an effective barrier to protect animals in the facility from unauthorized persons and animals. Fences must be at least 6 feet high unless approved in writing by the Administrator. Additionally, fences must be at least 3 feet in distance from the outside wall or fence of the primary enclosure to prevent physical contract between animals inside the enclosure and outside the perimeter fence.

3.129(a)

Feeding.

The outdoor food receptacle for two kangaroos and two wallabies was exposed to the weather and susceptible to contamination by pests. The food receptacle, a 6.9in x 36in plastic wading pool, had an excessive number of flies observed in and around it. Additionally, the food inside was noticeably wet from a recent rainstorm. Contaminated or wet food can cause illness or other health problems for the animals and may prevent them from obtaining adequate nutrition. Food and food receptacles must be located to minimize any risk of contamination by pests. The facility must ensure there is no molding, deterioration, contamination, or caking or wetting of food placed in self-feeders. Correct by September 4,2025.

3.150(g)

Facilities, general.

In an enclosure housing a Eurasian eagle owl, the Inspector observed approximately 1 foot of standing water in the primary enclosure. Standing water was also observed adjacent to multiple enclosures housing animals. Standing water can harbor diseases, pests, insect breeding grounds, and odors. Housing facilities must be equipped with disposal facilities and drainage systems that are constructed and operated so that animal waste and water are rapidly eliminated,

and the animals stay dry. Disposal and drainage systems must minimize vermin and pest infestation, insects, odors, and disease hazards. Correct by September 30, 2025.

This inspection and exit interview were conducted with a facility representative.
