Type: ROUTINE INSPECTION  
Date: 05-DEC-2023

---

### 3.133 Critical

#### Separation.

A capybara and a Patagonian cavy were injured due to incompatibility with their housing mates. A male capybara was acquired by the facility and being introduced to the female capybara. An employee let the male capybara out of his smaller enclosure and he was attacked by the female, causing a wound on his nose, across his back, and to his left hind limb. On inspection, the wounds on the nose and back were healing, but he was still sore and resisted putting weight on his left hind limb. He is currently under treatment by the attending veterinarian.

A male Patagonian cavy was acquired to introduce to the two female cavyes at the facility. The facility slowly introduced him and was three-weeks into the process, when the owner suspected he might have some scratches so she separated him from the females. An employee removed him from his separate enclosure and allowing the females direct access to him and they killed him.

Animals that are incompatible with one another can cause stress, injury, and death to their counterparts. Correct by ensuring all animals housed in the same primary enclosure are compatible. Correct by 7 December 2023. The facility took measures to remove the employees responsible.

This inspection and exit interview were conducted with the licensee.
