Type: ROUTINE INSPECTION
Date: 08-JUL-2014

2.40(b)(2)

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

A female Shiba Inu, no ID found, was observed to be limping on her right front leg. The dog was mostly non-weight bearing on this leg. This could be a sign of an injury or other medical condition. The facility representative was not aware of this dogs condition until it was pointed out to her by the inspectors. This dog has not received adequate veterinary care.

A female Rat Terrier, microchip # 018347545, was observed with an open wound on the inside of her right hind leg. This wound is approximately the size of a nickel and the area around the wound is swollen. This wound also has a yellowish brown discharge. This could be a sign of an injury or other medical condition. The facility representative was not aware of this condition until it was pointed out to her by the inspectors. This dog has not received adequate veterinary care.

The licensee must have these dogs evaluated by a veterinarian for an appropriate diagnosis and treatment plan. The licensee must ensure that all animals receive adequate veterinary care at all times.

To be corrected by: 12 July 2014

3.1(c)(1)(1)

HOUSING FACILITIES, GENERAL.

Rust

Throughout the sheltered facilities there are several access door frames that have become rusted. Inside of a sheltered facility, Building C the front coated wire panels and doors have become rusted. Rusted areas can no longer be cleaned and sanitized properly. The licensee must repair or replace the affected enclosures. The licensee must ensure that all surfaces are free of excessive rust that prevents the required cleaning and sanitization, or that affects the structural strength of the surface.

Inspection Report

Inside an outdoor kennel, housing huskies, the dog shelter is clad in metal sheets. The metal sheets at the bottom has been pulled loose and twisted upward. In another outdoor kennel, housing huskies, the metal roof ends are bent downwards towards the dogs. These bent and twisted metal pieces have created sharp points or edges. There are also screws used to hold the metal roof onto the dog shelter which have penetrated the wood leaving the dogs exposed to their sharp ends.

Within an outdoor kennel, housing poodles, the metal stripes of a shelter have been pulled loose at the bottom and twisted upward exposing the dogs to sharp edges.

Inside the sheltered facility, Building B there are weighted chains are used to keep the access doors shut. One chain had twisted wires on the end of it and at the dogs level creating sharp points.

Within a sheltered facility housing beagles, there is a strip of metal on the outside of the access door that has been pulled loose and bent upward and at the dogs level creating sharp points and edges.

Throughout both outdoor and sheltered facilities, the fencing is attached with wire. In many of the kennels the sharp ends of the wires were bent inward to the enclosure and at the dogs level.

These sharp points and edges can cause injury to the dogs. The licensee must repair or replace these sharp points and edges and also ensure that the housing facilities for the dogs, including dens and houses, are free of jagged edges or sharp points that might injure the animals.

This affects at least 12 dogs

Correct by: 16 July 2014

3.1(c)(3) REPEAT

HOUSING FACILITIES, GENERAL.

Cleaning

There is a buildup of grime on several of the access doors of the sheltered facilities. Inside of the sheltered building, Building C there is an accumulation of hair, dirt and grime built up on the front wire panels and doors. There is an accumulation of hair, dirt, grime, fecal material, and bedding hanging down from the underneath section of the outside floor sections of several of the sheltered facility enclosures.

The licensee must clean these affected enclosures and ensure that hard surfaces with which the dogs come in contact with are spot-cleaned daily and sanitized at least once every two weeks (or more often if necessary). All other surfaces of housing facilities must be cleaned and sanitized when necessary to satisfy generally accepted husbandry standards and practices.

This is a repeat non-compliant item.

3.1(f)

HOUSING FACILITIES, GENERAL.

Waste Disposal

Prepared By: STEPHANIE OSBORNE, A C I USDA, APHIS, Animal Care

Inspection Report

On the outside of the majority of the outdoor enclosures there is an accumulation of old fecal material, hair, and other organic material that has been removed from the enclosures. Outside one of the outdoor enclosures there is a pile of old, discarded fecal material that according to the facility representative has been there since this past winter. Outside one of the outdoor enclosures, housing 3 Huskies, there is a mostly decomposed cat carcass. This accumulation of old fecal material, hair, dirt, and the decomposing cat carcass can attract flies, and/or rodents which can transmit diseases to the dogs. The licensee must remove the old fecal material, hair, organic material and the cat carcass from the outside areas near the enclosures and also needs to establish and maintain a program that will ensure the facility is provided regular and frequent collection, removal, and disposal of animal and food wastes, bedding, debris, garbage, water, other fluids and wastes, and dead animals, in a manner that minimizes contamination and disease risks.

This affects 38 dogs.

To be corrected by: 12 July 2014

3.11(a)

CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

Daily Cleaning

Throughout the outdoor facility there is an accumulation of fecal material. Some of the fecal material had a dry appearance, which can indicate that it is not fresh. When questioned by the inspectors the facility representative indicated that the fecal material had not been removed for four days. The amount of fecal material made it difficult for the dogs to avoid stepping in it.

There is an accumulation of old and packed fecal material on several of the outdoor flooring sections of the sheltered facility. Some of the fecal material had a dry appearance, which can indicate that it is not fresh. Some of these enclosures had fecal material smeared and covering the majority of the flooring section and also on the outside walls of the enclosures. The amount of fecal material in these enclosures made it difficult for the dogs to avoid stepping in it.

Excreta must be removed from primary enclosures daily in order to protect the health and well-being of the animals and to reduce disease hazards pests, insects and odors. Licensee must remove the accumulated fecal material from these enclosures and ensure that all excreta and food waste is removed daily from primary enclosures.

This affects 53 dogs.

To be corrected by: 10 July 2014

3.11(b)(2)

CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

In at least 3 enclosures, the water bucket have been chewed excessively. The chewed and damaged areas of these buckets have a buildup of grime which does not allow for proper cleaning and sanitization. The buckets need
