Type: ROUTINE INSPECTION

Date: 25-OCT-2016

2.40(b)(2)

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

The black male alpaca housed with three other male alpacas has hair loss on his face. The hair is mostly gone from the bridge of his nose and the hair loss extends down both sides of his nose to his upper lip. The hair loss is most severe on the left side with hair loss under his left nostril and above his left upper lip. The facility records noted in June of 2016 that this alpaca had "minor hair loss on the bridge of nose, skin below uninjured, will watch for change." There is nothing in the records that documents the spread of the hair loss. The black male alpaca has had no testing or treatment for the hair loss. Hair loss has many causes such as parasites, trauma, infection, and other medical problems. The hair loss may be contagious to the other alpacas and people. During the inspection the public was observed hand feeding the four alpaca in the enclosure. The alpaca must be evaluated by the attending veterinarian to ensure that an accurate diagnosis is obtained and an appropriate treatment plan is developed and followed. This information, including the diagnosis, treatment, and resolution of the condition, must be documented and made available to the APHIS officials upon request. Correct by October 29, 2016.

3.58(a)

CLASSIFICATION AND SEPARATION.

A continental rabbit was housed in the same enclosure as a wallaby. Free roaming peacocks also have access to this enclosure. During this inspection one to four peacocks were observed in this enclosure with the rabbit and wallaby. Rabbits cannot be housed in same enclosure with any other species unless required for scientific reasons. The rabbit was separated from the wallaby at time of inspection. Facility must ensure that peacocks do not have access to the rabbit enclosure to protect health of the animal. Correct by November 2, 2016.

3.125(a)

FACILITIES, GENERAL.

The enclosure housing the two African crested porcupine had a protruding wire strand on the lower left corner of the chain link door. A large rock had fallen inside the enclosure from the back wall of the outdoor area leaving the height in this area only 27 inches from the ground. This rock and a nearby log could have been used to help the porcupines escape. All enclosures must be structurally sound and kept in good repair to protect the animals from injury and to contain the animals securely. Once APHIS officials identified the structural items, facility maintenance
