Type: ROUTINE INSPECTION
Date: 22-JUN-2023

3.125(a) Repeat

Facilities, general.

Several areas of the fencing are in disrepair:

-A section of the wire fencing is damaged in the wallaby enclosure across from the food storage room. The wire is in disrepair, loose and bent upward along the base for several feet. To correct this issue, the licensee stated he would replace this section of the fence.

-A short section of the wire fencing within the primary enclosure for the kangaroos has detached and is leaning over onto the ground. This section of the fencing is located near the western side of the facility.

-A section of the wire fencing in the enclosure with the two young alpacas needs repair. The fencing is loose and bends inward into the enclosure, and also curls upward at the base. This section of the fencing is located on the southwestern side of the enclosure near the water trough.

Unstable, bent or loose fencing may cause entrapment or other injuries to the animals. Maintenance issues must be identified and addressed in a timely manner to keep the facility structurally sound and in good repair, safeguard the animals from injury and to contain the animals.

3.125(c) Repeat

Facilities, general.

The main food storage room has large metal cans of pelleted feed that are not covered with lids. In addition, the room has numerous empty feed bags present, with debris and clutter noted on the floor.

Food must be stored properly to prevent contamination, deterioration and spoilage. All open supplies of food must be stored in leak-proof containers with a lid. The food storage room also requires cleaning and organization.

3.127(d) Repeat

Facilities, outdoor.

Inspection Report

Vegetation is pressing down on the perimeter fence in the southeastern corner of the facility. This has caused the wire fencing to loosen and bend, thus lowering the height of the perimeter fence well below 6 feet.

Outdoor housing facilities must be enclosed by a perimeter fence that is of sufficient height to keep animals and unauthorized persons out. A perimeter fence must be constructed so that it protects the animals in the facility by restricting animals and unauthorized persons from going through it or under it and having contact with the animals in the facility. A system must be in place to maintain a perimeter fence which is at least 6 feet in height.

This inspection and exit interview were conducted with the licensee.
