Type: ROUTINE INSPECTION
Date: 14-SEP-2016

2.40(b)(2) DIRECT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

One adult male mini Brahman named "Bob" has a penetrating wound, approximately four inches long, in the lower abdominal area in front of his right rear leg. This wound appears to have been caused by one of the longhorns housed in this enclosure due to the presence of several skin gashes in the same general area as the penetrating wound. Numerous flies were seen at the margins of this wound. There was a thick, yellowish discharge at the bottom edge of the wound. This injury may cause pain and discomfort in the affected area. The attending veterinarian (AV) must be consulted in order to diagnosis and treat this injury. To be corrected by: Sept 16, 2016.

3.127(b)

FACILITIES, OUTDOOR.

Nineteen goats, one lamb, and two alpaca are housed together in one outdoor enclosure. The single shelter in this enclosure is not large enough to comfortably house all of the animals during inclement weather. Additional shelter must be added to this pen to provide protection and prevent discomfort for all animals housed outdoors. To be corrected by: Oct 14, 2016.

3.129(b)

FEEDING.

In the outdoor enclosure housing 9 bovine, 1 bison, and 2 camels, there was one food receptacle (tire feeder) containing food at the time of inspection. One adult longhorn was observed dominating the feeder and swinging its head at the other animals that came close to the feeder. There were also two metal horse hay feeders in this enclosure, but both were empty and laying on the ground. A second tire feeder was located at the opposite end of the pen, but it did not contain any feed. Food receptacles must be in sufficient quantity and located so as to be accessible to all animals in the enclosure and shall be placed so as to minimize contamination. Sufficient numbers of food receptacles, appropriate for use by the animals housed in this enclosure, must be provided in order to assure that all animals have access to food. To be corrected by: Sept 16, 2016.

Inspection Report

SANITATION.

Excessive numbers of flies were observed around the heads of both camels. Both camels were observed closing their eyes and shaking their heads frequently in an effort to rid themselves of the flies. Flies can transmit diseases and cause discomfort/distress to the animals. A safe and effective program for the control of flies and other pests must be established and maintained at this facility. To be corrected by: Sept 16, 2016.

This inspection and exit interview were conducted with facility representatives.
