Type: ROUTINE INSPECTION  
Date: 15-AUG-2016

### 3.31(c)

#### SANITATION.

There were accumulations of items on the top of two racks of enclosures that had been there long enough that a thick layer of dust was present on the items and the tops of the enclosures. Rodent droppings were present in the dust and the owner stated that they have had rodents but generally do not have a problem as long as they are setting traps. Wild rodents can introduce disease and ectoparasites to the Guinea pigs. ·

The fly tape above the enclosures was completely covered with insects and the open windows in the facility did not have screens at the time of inspection. The owner stated that screens would probably help. Flying insects can transmit disease to the animals.

Correct by establishing and maintaining an effective program for the control of insects, ectoparasites, and avian and mammalian pests. The program should include methods to prevent and discourage entry of pests, and methods to eliminate pests. To be corrected by: 22 August 2016.

An exit briefing was conducted with the owner.
