WATERING.

A metal water receptacle in a mink enclosure had a moderate buildup of rust and contained dirty, brownish colored water with an accumulation of plant material floating on the surface. The presence of rust can prevent the required cleaning and sanitizing. Additionally, in another mink enclosure there was a metal water receptacle with a heavy accumulation of greenish algae coating the inside walls and bottom surface.

All water receptacles must be maintained in a clean and sanitary condition in order to ensure that the animals are provided with clean, potable water, to minimize disease hazards and to ensure that they maintain adequate hydration. Water receptacles must be cleaned or replaced as needed at a frequency that is adequate to maintain standard husbandry practices.

Correct by 07/03/2017.

This inspection and exit interview were conducted with a facility representative.
