

Inspection Report

Stillmeadow Inc.
12852 Park One Drive
Sugar Land, TX 77478

Customer ID: **1503**
Certificate: **74-R-0049**
Site: 001
STILLMEADOW, INC.

Type: ROUTINE INSPECTION
Date: 19-MAY-2015

3.31(a)(1)

SANITATION.

An excessive accumulation of debris consisting of food, excreta and hair was noted on the sides and front of multiple enclosures housing guinea pigs. Primary enclosures housing guinea pigs must be cleaned frequently enough to prevent an accumulation of excreta and/or debris. Adequate cleaning is necessary to help reduce potential disease transmission and odors.

The facility does not have standard operating procedures in place to address spot or periodic cleaning of guinea pig enclosures but management began the process prior to the end of this inspection. Correct by: Guinea pig enclosures must be adequately cleaned in the future.

3.56(a)(1)

SANITATION.

The floor of the primary enclosure housing rabbit # 18940 contained excessive excreta. An almost confluent layer of dried excreta covered the entire slatted floor leaving no clean resting surface available for the animal. Primary enclosures for rabbits must be kept reasonably free of excreta and debris to ensure adequate sanitation and cleaning to minimize soiling, compromise of dermal integrity and disease potential. At least two other rabbit enclosures were noted to have excessive amounts of dried feces on the slatted floors but the excreta was not yet present in a confluent layer covering the entire floor. The facility indicated that the rabbits would be removed from the dirty surfaces prior to the close of business.

The facility does not currently have standard operating procedures in place to address spot or periodic cleaning of the inside of rabbit enclosures but management began the process prior to the end of this inspection. Correct by: Rabbits must be housed on reasonably clean surfaces in the future.

The inspection and exit interview were conducted with management and APHIS personnel.
