COLORADO STATE UNIVERSITY

Type: ROUTINE INSPECTION
Date: 16-NOV-2021

2.33(b)(3)

Attending veterinarian and adequate veterinary care.

In an enclosure housing four adult white-tailed deer (numbers 4151, 4153, 4155, 4156), two of the deer have multifocal areas of hair loss along their backs and sides. The APHIS inspector and a staff veterinarian witnessed one of the unaffected deer pulling out the hair of an affected deer. There are no records showing that this issue has been observed by caretakers or reported to the veterinary staff.

Effective daily observations allow the facility to assess the health of the animals, including any injuries, behavioral problems, or compatibility issues. Timely reporting of new conditions is important to prevent worsening of any problems and ensure proper care. The facility must observe all animals daily and then ensure a mechanism of direct and frequent communication with the attending veterinarian so that timely and accurate information on problems of health, behavior, and well-being are conveyed and so that the medical conditions of the animals can be evaluated by the veterinarian.

To be corrected by 24 November 2021.

Inspection Report

been raked up for collection but remains within the enclosure.

- There is an accumulation of feces in the veterinary teaching cow shelter structure that covers more than half of the floor space.

-There is an accumulation of feces in the veterinary teaching sheep pen that covers a majority of the shelter floor and enclosure. There is also a large pile of feces and deteriorating hay that has been raked up for collection but remains within the enclosure.

-There is an accumulation of feces in the veterinary teaching sheep barn pasture that covers a majority of the shelter floors and enclosure, especially around the feeders.

-There is an accumulation of feces in the ARBL sheep pen that covers the entirety of the shelter area and more than half of the enclosure.

-There is an accumulation of feces in the middle stallion pen at the Equine Repro Lab in front of the shelter and around the feeding area.

-There is an accumulation of feces in the teaching mare pasture at the Equine Repro Lab that covers a majority of the floor of both shelter structures and surrounds the feeding area.

Accumulations of excreta are especially of concern when they occupy an animal's shelter structure or interfere with its access to food and water sources. These areas also attract pests and can play a role in disease transmission. The registrant must ensure that excreta be removed from primary enclosures as often as necessary to prevent contamination of the animals contained therein and to minimize disease hazards and odors.

This inspection was conducted from 11/16/2021 to 11/18/2021 and the exit interview was conducted on 11/22/2021 with facility representatives.
