Facilities, general.

The facility has several enclosures in need of repair to protect animals from injury and to contain the animals.

- A degu was found outside of its primary enclosure and inside of an enclosure housing nine pigeons and a Lady Amherst pheasant.

- There is a large portion of underlying dig wire and side wire exposed along the front of the enclosure of both red fox enclosures, creating large holes/gaps under the wire flooring. The dig wire is a 2" x 2" mesh, large enough for a leg or paw to reach through.

- In the African Crested Porcupine enclosure, there are two layers of mesh under the enclosure floor to prevent animals from digging and escaping. Inside of one shelter, the mesh has been completely dug up and broken apart, leaving large portions of wire exposed and even a tall, sharp edge of wire protruding from the floor at least 12" up into the shelter. Additionally, there is an area of tangled wire mesh sitting on the surface of the enclosure floor.

- One side of the hay rack in the Texas Doll Sheep enclosure has significant damage to the wire panel, exposing numerous sharp edges of wire.

Having exposed wire mesh and sharp edges of wire in enclosures can lead to animals becoming injured or entrapped. Additionally, animals that are not securely contained in their primary enclosures can become injured, lost, or killed by outside predators. Correct by ensuring outdoor housing facilities are structurally sound and maintained in good repair to protect the animals from injury and to contain the animals.

This inspection and exit interview were conducted with the licensee.
