ROSE MARLOW

Type: ROUTINE INSPECTION
Date: 15-SEP-2015

2.40(b)(2) DIRECT REPEAT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

An approximately 1 1/2 year old female Golden Retriever (#71) was holding up her left front leg while standing and sitting and also favored the left front leg while walking. On closer observation, the fourth digit on the left front foot appeared abnormal compared to the rest of the digits. The tissue surrounding the nail was firm and appeared enlarged/swollen and reddened with an overall mass-like appearance. The redness of the skin was more significant on the inside portion of the toe and the fur was darker red in this area. The nail appeared to be pushed to the side and/or growing at an angle. The pad beneath the toe was also irregular in appearance. There was a hole-like lesion on the top of the pad, just beneath the nail, where it appeared like a section of the pad was missing. The edges of the pad's tissue in this area were irregular. The pad was also a reddish pink color closest to the lesion and a yellowish discharge-like material was noted along the edge of this lesion on the pad. The licensee had recently hosed down the concrete in the enclosure and the dog's entire foot was wet. When asked at the beginning of the inspection if any of the dogs were under veterinary care, the licensee replied "no". According to the licensee this dog had been seen by a veterinarian but couldn't remember when. When asked if this dog was currently receiving treatment the licensee replied "no" and she said she could not remember what she had given for treatment. According to written documentation provided by the licensee at the facility, the dog was examined by a veterinarian on March 22, 2015. Treatment recommendations were given at that time and included to "soak or scrub" and to give "Amoxicillin twice daily for at least 14 days". Also included on the veterinarian documentation was: "Dx possible nail bed infection or possible tumor". According to the licensee, she would see the dog favor the foot off and on. Although this dog was examined by a veterinarian in March (approximately 6 months ago), the dog is currently not receiving treatment and is currently showing signs of discomfort. This dog's condition could be due to injury, infection and/or another veterinary medical condition which could be painful. The licensee must have this animal examined by a licensed veterinarian in order to ensure that an accurate diagnosis is obtained and an appropriate treatment plan is developed and followed. The licensee must ensure that all animals receive adequate veterinary care at all times.

Inspection and exit interview conducted with licensee, Chad Proctor ACI, and Erika Leisner VMO.
