Type: ROUTINE INSPECTION
Date: 29-JUL-2014

2.40(b)(2) DIRECT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

In the outdoor enclosures was a female Siberian Husky (M/C# 092811836) that was very thin and had a significant abdominal tuck. The hair coat had shed from the sides and hips but was still thick and in the process of shedding along the neck, back and loin. When the dog was palpated, the spine, hips and ribs were easily felt and there was a significant muscle loss. The dog was in a large enclosure with 2 larger dogs. Dogs that are very thin may have other medical concerns. The owner must have the dog evaluated by a veterinarian for diagnosis and treatment. The dog must be housed in a separate enclosure from other dogs. Documents of diagnosis and treatment must be available to APHIS officials.

TO BE CORRECTED BY: 1 AUGUST 2014

Sonny, a male red and white King Charles Cavalier Spaniel had a left eye that was bulging and had brown discoloration on the surface of both eyes. Eye conditions can be painful and when not properly treated, can lead to loss of vision. The dog must be evaluated by a veterinarian for diagnosis and treatment. Documents of diagnosis and treatment must be available to APHIS officials.

TO BE CORRECTED BY: 1 AUGUST 2014

Scarlett (m/c# 092811344) a female Cocker Spaniel had a red mass on the outside lower lip on the right side. It was about 1/2" diameter in size and shiny. This dog had an ongoing eye condition that was being treated, as stated by the owner. There was a greenish discharge from both eyes although the eyes were clear and there was no redness observed. The cheek teeth and canine teeth had hard dark material on their surfaces. The dark brown material may affect the health and well being of the affected animals if left untreated and can affect the way that the dog eats. The applicant should consult with the veterinarian to develop a dental care plan for all the dogs at the facility. This plan should cover how dental disease will be identified and how differing degrees of disease will be treated. The dog needs to be evaluated by a veterinarian so that a proper diagnosis can be made regarding the observed problems and a treatment plan can be implemented. The licensee should document the diagnosis and the treatment plan, and have it available to APHIS officials.

Inspection Report

TO BE CORRECTED BY: 1 AUGUST 2014

There was female Brindle French Bulldog (Paris, m/c# 4A014D3004) that had a large gray, irregularly shaped, roughened mass on the top of the head. It was approximately 1/2" above the surface of the skin and 1 1/2" in diameter. The owner stated that the dog had been evaluated by a veterinarian several months ago, but the mass has increased in size. There was no documentation of the evaluation. Masses that change or grow may indicate a more serious health condition. Due to the changes, the dog must be evaluated by a veterinarian for diagnosis and treatment.

TO BE CORRECTED BY: 5 AUGUST 2014

2.50(a)(2)

TIME AND METHOD OF IDENTIFICATION.

(2) Live puppies or kittens, less than 16 weeks of age

****There were 15 puppies under the age of 16 weeks that had no identification. One puppy was weaned and separated from the dam. Identification numbers were listed on the APHIS 7006 forms for puppies that had been sold, but the same numbers were used for each litter, thereby, using the same number numerous times. Proper and accurate identification is necessary to ensure that each animal's identity can be known with certainty when medicating, to facilitate record keeping requirements and to track the dogs when ownership is transferred. The owner needs to assure that all live animals throughout the facility are identified and that proper records are made and maintained.

TO BE CORRECTED FROM THIS DAY FORWARD.

An exit interview was conducted with a facility representative.

MDA inspector and veterinarian were also present on inspection.
