LIONS, TIGERS & BEARS, INC

Type: RE-LICENSE INSPECTION

Date: 13-DEC-2022

2.40(b)(3) Direct

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

The skunk, named Stinker, had an area of hair loss approximately 6X9 cm in size and located at the base of its tail. The skin in this area appeared to be thickened with a dry and flaky surface. The facility representative stated that they had not consulted with a veterinarian regarding the animal's condition prior to the inspection. Coat/hair loss can be caused by problems such as, but not limited to trauma, parasites, stress, behavior, and other dermatologic medical issues. Failure to observe medical problems and/or communicate those problems to a veterinarian can result in prolonged pain, suffering, and even death. The facility representative must observe all animals daily and then ensure a mechanism of direct and frequent communication with a veterinarian, so that timely and accurate information on problems of animal health, behavior, and well-being is conveyed. To be corrected before the next re-license inspection.

3.81

Environment enhancement to promote psychological well-being.

At the time of inspection, there was no documented program of environmental enhancement for the non-human primates housed at the facility. An adequate environmental enhancement program is essential in promoting the psychological well-being of non-human primates. Dealers, Exhibitors, and research facilities must develop, document, and follow an appropriate plan for environment enhancement adequate to promote the psychological well-being of non-human primates,

Inspection Report

it must be in accordance with the currently accepted professional standards and as directed by the attending veterinarian.

To be corrected by the next re-license inspection.

3.125(a)

Repeat

Facilities, general.

Two primary enclosures need maintenance and/or repair:

- On the right side of the gate, for the enclosure housing two pigs, is a wooden post with a heavy gage U-Shaped Fencing Staple that has been broken in half. The break produced two sharp pieces that are bent outward. On the inside of the enclosure there are also 4 screws sticking out of the post approximately 1". Protruding sharp, jagged edges may cause injury to the animals as they pass by.
- In the leopard enclosure, there is a crossbeam which helps support the roof netting. This crossbeam shows signs of rot and decay. The crossbeam appears to be a 4X4 wooden board with numerous pieces missing from deterioration. This section of wood needs to be replaced to keep the enclosure in good repair for the safety and containment of the animal.

Outdoor housing facilities shall be structurally sound and shall be maintained in good repair to protect the animals from injury and to contain the animals. To be corrected by the next re-license inspection.

3.127(d)

Repeat

Facilities, outdoor.

A section of the perimeter fence, adjacent to the pig enclosure, has a gate. At the time of inspection, the gate was slightly opened. Animals and unauthorized people can use this opening to enter and exit the area and gain access to the animals behind it. The perimeter fence must be constructed so that it protects the animals in the facility by restricting animals and unauthorized persons from going through it or under it and having contact with the animals in the facility, and so that it can

function as a secondary containment system for the animals in the facility. To be corrected by the next re-license inspection.

This is a (1st/2nd) Re-License Inspection for a Class ("A"/ "B"/ "C") license. The inspection and exit briefing were conducted with the applicant.

All items must be in compliance within (2 / 1) more inspection(s) or by (date-60 days counted from 1st RL Inspection) or the applicant will forfeit the license fee and must wait 6 months to reapply. Please contact your inspector to schedule your next Re-License Inspection.

Regulated activity can continue under your existing USDA license until it expires.
