Type: ROUTINE INSPECTION
Date: 12-APR-2018

2.40(b)(3)

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

The white-tailed deer had a reddish gash with hair loss on the left side of her chest approximately 2 inches long by 1/2 inch wide. According to the licensee the deer was injured about 2 or 3 weeks ago and was being treated by caretaker with a ointment (name of ointment unknown by licensee). There were no observation or treatment records maintained by the caretaker. The attending veterinarian was consulted on April 10, 2018 and he examined and treated the deer with an antibiotic.

The current Program of Veterinary Care (PVC) does not list standardized treatment protocols for the facility to treat common conditions and injuries. When animals are identified as needing care, the facility must consult the attending veterinarian in a timely manner. Failure to observe sick or injured animals and to communicate these conditions to the attending veterinarian will lead to failure to deliver adequate veterinary care to the animals.

All animals must be observed daily to assess the health and well-being so that problems of animal health can be addressed by the attending veterinarian. Correct by performing effective daily observations of all animals and communicating with the attending veterinarian in a timely manner when there are problems with animal health, behavior, and well-being. Correct from this day forward.

2.75(b)(1)

RECORDS: DEALERS AND EXHIBITORS.

Disposition records were not available for 11 goats and 2 fallow deer. Records must be kept and maintained on all animal births, deaths, acquisitions, and dispositions to help track animals, document, changes in ownership and to comply with the animal welfare regulations. Disposition records must list the name and address of buyer or receiver, the type and number of the animals, and the date of the disposition. Correct by April 14, 2018.

3.125(a)

FACILITIES, GENERAL.

Structural strength. The white-tailed deer enclosure had a 4 1/2 inch gap between the front gate and the fence post. A piece of blue bale twine was securing the gate to the fence post. A protruding bolt (approximately 1 inch long) was

on the left side of the gate. The white-tailed deer was recently injured in this enclosure. Facilities must be structurally sound and maintained in good repair to protect animals from injury and to contain the animals securely. The gap between the front gate and fence post was repaired at time of inspection. Corrected during inspection.

This inspection and exit interview were conducted with the owner.
