Type: ROUTINE INSPECTION
Date: 28-SEP-2016

2.40(b)(2) DIRECT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

Several dogs are in need of veterinary care. Two have immediate needs to receive attention because their conditions are directly affecting their health and well-being:

#3807 Male Yorkie has several smaller areas of mats along his belly and chest and in his flanks. This dog has a strong odor of urine about him, suggesting that the prepuce is being held tightly to his body by the matted fur along his belly. This has the potential to create severe irritation of the skin on his belly if he cannot avoid to urinate on himself due to the matting. This dog must be attended to, which may include but may not be limited to, trimming the matted fur, bath, and assessment of the skin on the belly and near the prepuce.

#4135 Female Yorkie with matting of the fur along all four legs, underneath the chest, and along the back end. This dog was noted to have a slight limp, possibly due to the discomfort of having the hair along the legs and feet matted and pulling constantly away from the skin. This dog must receive adequate care, including but not limited to trimming the matted fur and assessment and treatment for her limp.

Correct by: end of day 9/29/16.

The following dogs have matted hair in need of trimming in order to assess the condition of the skin underneath:

#8096 Male Yorkie has mats along his chest/sides of belly as well as the back and his rear legs. An area on the left side has a small patch where hair has been pulled out of the skin because of the large mat.

At least one other dog, a white female Yorkie in the turnout yard, had severe matting along the topline and back end. This dog must be given a thorough grooming both to remove the matted fur and assess the condition of the skin underneath for the need for possible treatment.

A female Yorkie #2262 has severe roughened, swollen, dark skin on the inside of both ears. This signals a chronic irritation of the ears, possibly from infection. This dog also has matted fur around both of its eyes, with some greenish clear discharge from the right eye. These signs indicate irritation of the eyes, possibly from the long facial

hairs rubbing the surface of the eyes. This dog must be seen by a veterinarian to assess the ears, in addition to having its facial hair trimmed to prevent further eye irritation.

Correct by: 10/5/16

3.1(c)(3)

HOUSING FACILITIES, GENERAL.

The majority of the dog doors leading from the inside to the outside portion of the primary enclosures have a buildup of dirt in and around the doorframes. Additionally, the outdoor washdowns have a buildup of material that has a pungent odor. Accumulation of excreta and debris can contribute to disease in the animals by allowing viruses and bacteria to grow, or in the case of odor from washdowns, can cause discomfort or attract pests which can carry disease, like flies. Surfaces which the dogs can contact must be spot-cleaned daily and sanitized appropriately. All other surfaces of the housing facility, including the washdowns, must be cleaned and sanitized when necessary to satisfy generally accepted husbandry standards.

Correct by 10/12/16.

3.1(f)

HOUSING FACILITIES, GENERAL.

Two partially decomposed carcasses of neonatal puppies were noted in the upper turnout yard where 5 adult dogs were able to access. Dead animal tissue can potentially cause illness in other dogs either directly if they are able to come into contact with it or by attracting other pests such as flies, rodents, or birds which may also carry disease. Dead animals must be properly disposed of where their bodies will not be accessible to other animals or to otherwise impact the health and well-being of the other animals (e.g., attracting pests or emitting unpleasant odor). The bodies were removed at the time of exit.

Correct from this time forward.

3.3(e)(1)

SHELTERED HOUSING FACILITIES.

There are several shelter structures within the outside fenced areas that are not made of materials that are impervious to moisture. In addition, several of these structures have grass/dirt flooring that is not directly exposed to sunlight. There are several pieces of bare wood laying on the inside of the fencing and around the buildings located within the fenced area. There are several support structures for the turnout yard fence that is made of bare wood or rusted metal.

Inspection Report

These surfaces are not able to be readily cleaned and sanitized. This can contribute to odor and disease hazards within the facility. All surfaces that come in contact with the dogs must be impervious to moisture and able to be cleaned and sanitized. All flooring surfaces of shelter structures must be made of a solid, sanitizable material or be directly exposed to sunlight. In addition, all surfaces, including shelter structures and flooring materials, must be spot cleaned daily and sanitized at least once every 2 weeks.

Correct By: 10/12/16

3.6(a)(2)(i)

PRIMARY ENCLOSURES.

There were several areas of the outside fencing that were in disrepair causing sharp points or jagged edges within the animals enclosure. These areas can puncture or injure the animals. The Licensee must ensure that all primary enclosures are constructed and maintained without any sharp points or jagged edges that could injure the animals contained therein.

Correct by: 10/12/2016

This inspection and exit briefing were conducted with the Licensee and Facility Representative.
