3.128

SPACE REQUIREMENTS.

Section 3.128 Space requirements: The capybara is housed in an indoor enclosure without a water receptacle that is large enough for it to at least submerge its body into water. The capybara has a water dish and a shallow pan with about 4-6 inches of water where it defecates. Under natural conditions capybara spend a significant portion of their time in water, compliance with space requirements means there should be both dry and aquatic portions of the primary enclosure, each which, at a minimum, provide sufficient space to allow each animal therein to make normal postural and social adjustments with adequate freedom of movement. The capybara use to be housed outdoors with a large tub that it could enter and at least submerge its body and move in the water. Correct by providing the capybara a water receptacle/pool that is large enough and deep enough for it to submerge its body into the water and move in the water. Correct by July 7, 2015.

3.131(c) REPEAT

SANITATION.

Section 3.131(c) Housekeeping: A role of fencing, a chain link fencing panel, and black tub were left between the camel enclosure and perimeter fence. These items were removed during the inspection. A wood hutch is stored outside the perimeter fence. There are tall thick weeds/vegetation growing against the outside of the enclosure fencing for the four Scottish Highland cattle, 4 sheep and 12 goats. It is difficult to walk through the vegetation to view the enclosure. The dense vegetation against the enclosure is good cover for pests. The vegetation against the enclosure fence must be removed to allow access to the enclosure and to deter pests. Clutter must be removed from animal areas to deter pests and for the safety of the animals. This is a repeat non-compliance that remains uncorrected.

An exit briefing was conducted with the owner.
